

Superior Solutions

To Meet and Exceed The Unique and
Wide-ranging Requirements

Powering Business Worldwide

Energizing a world that demands more.

We deliver:

- **Electrical solutions** that use less energy, improve power reliability and make the places we live and work safer and more comfortable
- **Hydraulic and electrical solutions** that enable machines to deliver more productivity without wasting power
- **Aerospace solutions** that make aircraft lighter, safer and less costly to operate, and help airports operate more efficiently
- **Vehicle drivetrain and powertrain solutions** that deliver more power to cars, trucks and buses, while reducing fuel consumption and emissions

Model Selection Guide

Complete Model Selection Guide for IZM6 Series Air Circuit Breaker	91
--------------------------------------------------------------------------	----

IZM6 Series Air Circuit Breakers**Product description**

The IZM6 series air circuit breakers are a new generation of high-performance air circuit breakers with sophisticated technology and comprehensive functions, offering safety and reliability.

The circuit breakers are suitable for use in electrical distribution networks with AC 50Hz/60Hz, rated operating voltage up to 690V, and rated operating current of 4000A and below, to provide functions such as measurement, diagnosis, analysis and communication, precise selective protection and power monitoring.

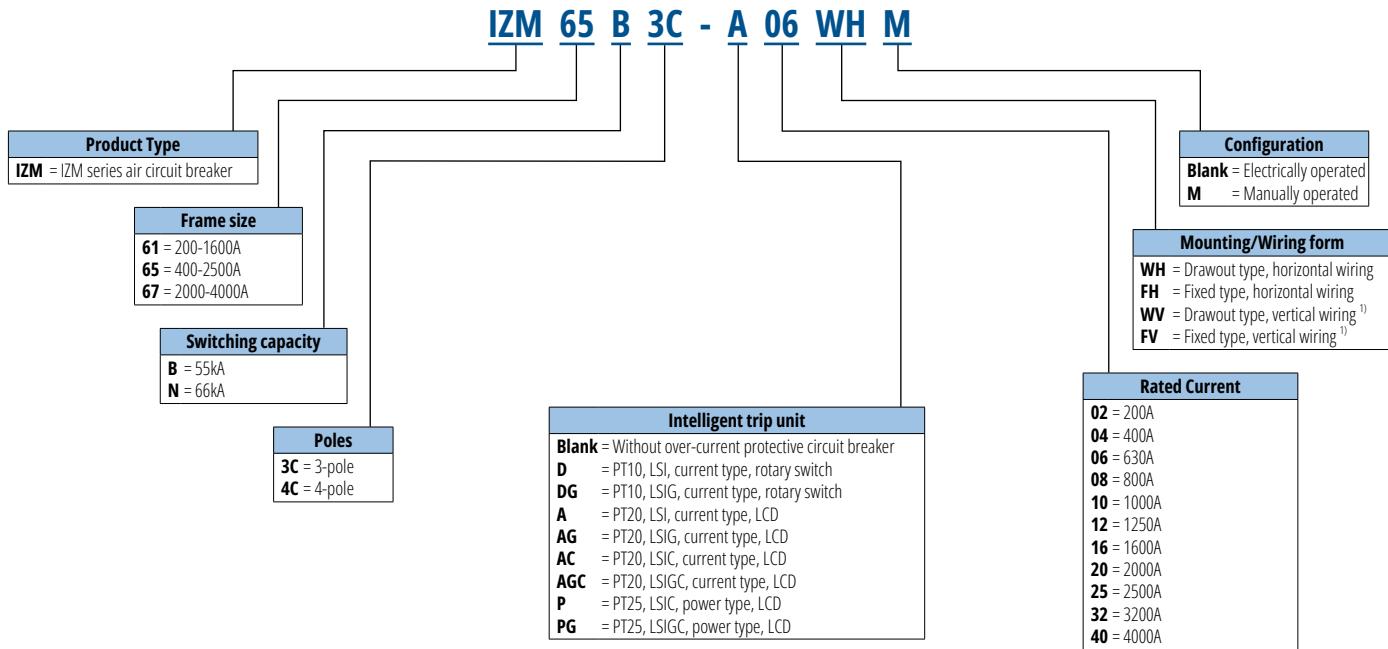

The Circuit Breaker Complies With Below Standards:

IEC 60947-1 and GB14048.1	Low-voltage switchgear and controlgear	Part 1: General
IEC 60947-2 and GB14048.2	Low-voltage switchgear and controlgear	Part 2: Circuit breaker
IEC 60947-4-1 and GB14048.4	Low-voltage switchgear and controlgear	Part 4-1: Contactors and motor-starters. Electro-mechanical contactors and motor-starters (Including motor protector)
GB/T 14597	Climatic environmental conditions at different altitudes for electrical products	
GB/T 2421.1	Environmental testing of electrical and electronic products:	Overview and guidelines
GB/T 20626.1	Plateau electrical and electronic products for special environmental conditions	Part 1: General technical requirements
GB/T 2423.1	Environmental testing of electrical and electronic products	Part 2: Test method - Test A: Low temperature
GB/T 2423.2	Environmental testing of electrical and electronic products	Part 2: Test method - Test B: High temperature
GB/T 2423.4	Environmental testing of electrical and electronic products	Part 2: Test method - Test Db: Alternating damp heat test method
GB/T 2423.17	Environmental testing of electrical and electronic products	Part 2: Test method - Test Ka: Salt mist
GB/T 2423.18-2000	Environmental testing of electrical and electronic products	Part 2: Test method - Test Kb: Salt mist, alternating (sodium chloride solution)

IZM6 Series Air Circuit Breakers

Model Description

Catalogue Number of IZM6 Series Air Circuit Breakers (Standard Configuration)

220Vac Electrically Operated

Fixed type:

- ① Fixed circuit breaker's basic device, including 4CO auxiliary contacts
- ② Wiring terminal
- ③ PT series intelligent trip unit
- ④ Over-current trip switch (OTS) (1CO)
- ⑤ Door escutcheon
- ⑥ Charging motor (220V AC)²⁾
- ⑦ Shunt trip (220V AC)²⁾
- ⑧ Closing spring release (220V AC)²⁾
- ⑨ 220VAC/DC to DC24V power module, for trip unit display³⁾

Withdrawable type:

- ① Withdrawable circuit breaker's basic device, including 4CO
- ② Cassette
- ③ Safety shutter
- ④ Wiring terminal
- ⑤ PT series intelligent trip unit
- ⑥ Over-current trip switch (OTS) (1CO)
- ⑦ Door escutcheon
- ⑧ Charging motor (220V AC)²⁾
- ⑨ Shunt trip (220V AC)²⁾
- ⑩ Closing spring release (220V AC)²⁾
- ⑪ 220VAC/DC to DC24V power module, for trip unit display³⁾

Notes: ¹⁾ For IZM67 only

²⁾ Not included in the simple configuration of manually operated devices

³⁾ The circuit breaker is equipped with a power module as standard

For power module input voltage details, refer to IZM6 operating manual

Notes: ¹⁾ Icw (1s) 50kA is applied to 440V.

²⁾ The IZM61/65/67 provides an isolated circuit breaker. The PT series electrical trip unit is removed from the IZM61/65/67 circuit breaker in accordance with the requirements of Annex L of GB/T14048.2-2020/IEC 60947-2, and the remaining configurations are consistent with standard circuit breakers. The isolated IZM61/65/67 circuit breaker is used in conjunction with an external protection relay (maximum delay of 400ms) to achieve a breaking capacity (at maximum rated operating voltage U_e) to the rated short time withstand current Icw (1 second).

Notes: "✓" =The function is available; "—" = the function is not available. The following notes are only available to PT series trip units.

^①This function can be viewed and operated via the PTM software on PT10, and via the PTM software or display buttons on PT20/25.

^②This function is set by the factory before delivery from the factory, and reacts to the peak current.

^③This function requires an auxiliary power supply to be connected to.

^④The simulated current test function is achieved via the PTM software. If the test requires tripping verification, an auxiliary power supply is required.

^⑤This function is achieved via the PTM software.

^⑥This function is achieved via the PTM software. Current and voltage waveforms of each phase before and after a fault occurs will be recorded (PT25 only).

^⑦Trip integrated internal temperature monitoring, for over temperature alarm when the trip unit's temperature exceeds 80°C, and over temperature tripping when the temperature exceeds 85°C.

^⑧Built-in.

PT Electronic Trip Unit

The new-generation IZM6 air circuit breaker is equipped with new PT electronic trip unit for protection and metering. The PT electronic trip unit offers a complete range of models, flexible for use and selection according to actual protection needs.

PT Unit Function

Trip unit model	Catalog No.	Protection style	LCD	Rotary switch	Ground fault	Modbus RTU	ZSI	Relay output	Digital input
PT 10	PT10	LSI		•					
	PT10G	LSIG		•	•				
PT 20	PT20	LSI	•						
	PT20G	LSIG	•		•				
	PT20C	LSI	•			•			
	PT20GC	LSIG	•		•	•			
PT 25	PT25	LSI	•			•	•	•	•
	PT25G	LSIG	•		•	•	•	•	•

Multiple Options

- The PT units are available in LSI and LSIG types, suitable for all power distribution systems.
- The PT10 units provide systems with electronic trip units for standard protection, ensuring high reliability and trip accuracy. Overload, selective short circuit, short circuit and ground faults can be prevented.
- The PT20/25 units offer more advanced protection and system management functions, while supporting customized requirements.

Connectivity

- All PT units are equipped with a USB port, which can be connected to the PTM software to configure, test, and monitor different protections.
- An optional built-in Modbus communication port is available for PT20/25 units. Through Modbus, circuit breaker status (Closed/Tripped/Opened), settings and operation information can be obtained.

Password security

The cybersecurity of your system is critical. The PT electronic trip unit settings are password protected to reduce the risks of unauthorized changes. Correct password (0000 by factory default) must be entered in the "EDIT SETTINGS" menu to change non-rotary settings. When the change takes longer than 10 seconds, the authorization will time out. When wrong password is entered three times, there will be a ten-minute lockout period, during which access will be prohibited.

There are two levels of password: "Administrator" and "User". The factory default is the administrator level, and the password is "0000". The administrator can create a user and decide on the permissions of that user.

The factory default settings for the trip unit are as follows if without special requirements from users.

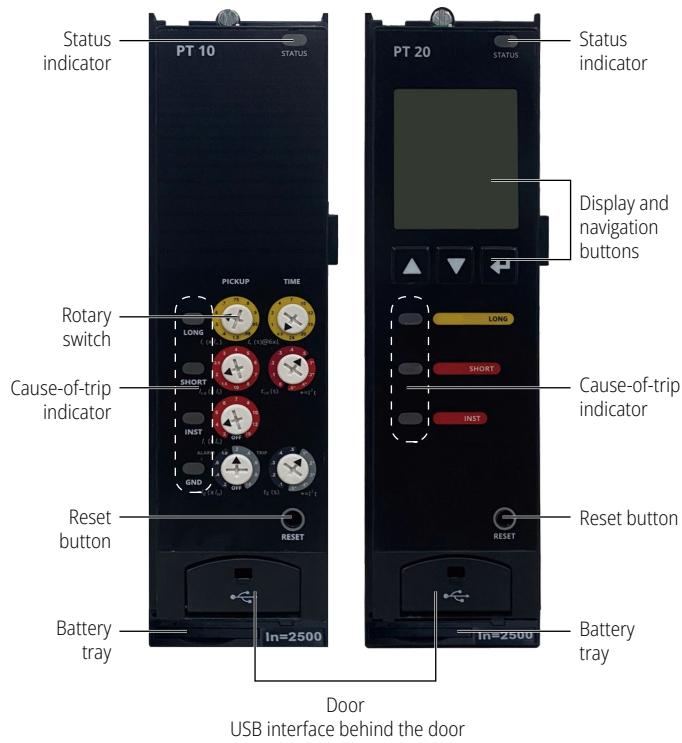

Over load long delay protection	I_f	I_n
	t_f	4s
Short circuit short delay protection	I_{sd} (flat)	$3I_f$
	t_{sd} (flat)	0.1s (flat)
Short circuit instantaneous protection	I_i	$5 I_n$
Ground fault protection	I_g	$0.8 I_n$
	t_g	0.5s (flat)

Frequency protection	OFF	
Making current release (MCR) peak	IZM61 1600A frame	36kA
	IZM65 2500A frame	56kA
	IZM67 4000A frame	90kA

IZM6 Series Air Circuit Breakers

Trip Unit Functions

Interface Functions of the Trip Unit

Status Indicator

- All PT trip units have an indicator at the top right labeled "STATUS". The indicator offers below four statuses:
 - The indicator
 - blinks green (on and off once each second), indicating that the trip unit is operating normally.
 - The indicator blinks orange (on and off once each second), indicating that one or several faults shown below is detected:
 - Battery low or not connected
 - Auxiliary power supply voltage low
 - Over load
 - Thermal memory alarm
 - Over temperature alarm
 - Clock error
 - The indicator blinks red quickly, indicating that that one or several faults shown below is detected, which requires immediate action to rectify the problem and/or replace the trip unit.
 - Trip actuator release damaged
 - Firmware error
 - Calibration error
 - Mechanism error
 - The indicator remains off, indicating that there is no auxiliary power supply applied or insufficient primary current to power the trip unit. This does not indicate a malfunction. The status indicator will resume blinking when auxiliary power is supplied or breaker load increases.

Cause-of-Trip Indicator

- There are four pickup/cause-of-trip indicators on the face of the trip unit label "LONG", "SHORT", "INST" and "GND". After a trip event, the indicator blinks (one second on, three seconds off) and the cause will be shown on the display if an auxiliary power is applied. The indicator and the display can be cleared by pressing the RESET button. Following is a list of conditions if the indicator blinks:
 - "LONG" – Blinking indicates a long delay trip or over-temperature trip has occurred.
 - "SHORT" – Short delay trip or mechanism error.
 - "INST" – Instantaneous trip, Making Current Release (MCR) trip, or high instantaneous trip has occurred
 - "GND" – Ground trip or ground alarm condition has occurred.

Rotary Switches

These rotary switches can be used to set up protection values on PT10.

Reset Button

The button labeled "RESET" can be depressed using a small tool. Press this button to clear the blinking cause-of-trip indicator, clear the configurable relay's locking alarm message, and clear the ZSI "check mark" on the display (lit on after a ZSI input signal is detected).

Display and Navigation Buttons

The PT20/25 trip unit has a display on the front. The display provides information such as metered values, events, and the interface to select certain configuration options. The interface is simple and intuitive, enabling operators to have quick and easy access to all information and settings by minimizing installation and commissioning time. Information is presented on the display in either English or simplified Chinese. Back lighting is included with a power saving feature that after 30 seconds of inactivity will turn the backlight off.

There are three navigation buttons below the display. They are used to set directly all the protection functions in a few simple steps.

Battery Tray

At the bottom of the trip unit is a small tray which holds the battery. When the trip unit is not powered, this battery offers power to the cause-of-trip indicator and real-time clock, and assist the trip unit to record events.

A battery icon at the bottom of the display (PT20/25 only) indicates remaining battery life. For rotary type trip unit (PT10), the battery life can be viewed on the computer. The battery plays no part in the protection functions of the trip system. This battery is the standard type CR 2032 coin-cell.

Door and USB port

The door can be opened downward with a screwdriver to expose the micro-B USB port. The USB is a micro-USB connector utilizing USB 2.0 protocol. This USB connection may be used with the Power Trip Protection Manager software to configure and monitor the trip unit.

A USB connection will also typically provide power from the host side of the USB cable to power up the trip unit when the auxiliary power supply is not available. The battery pack available in the market can also provide power to the trip unit. The USB connection is intended for temporary use to configure, monitor or test a trip unit.

Ground Fault Sensing

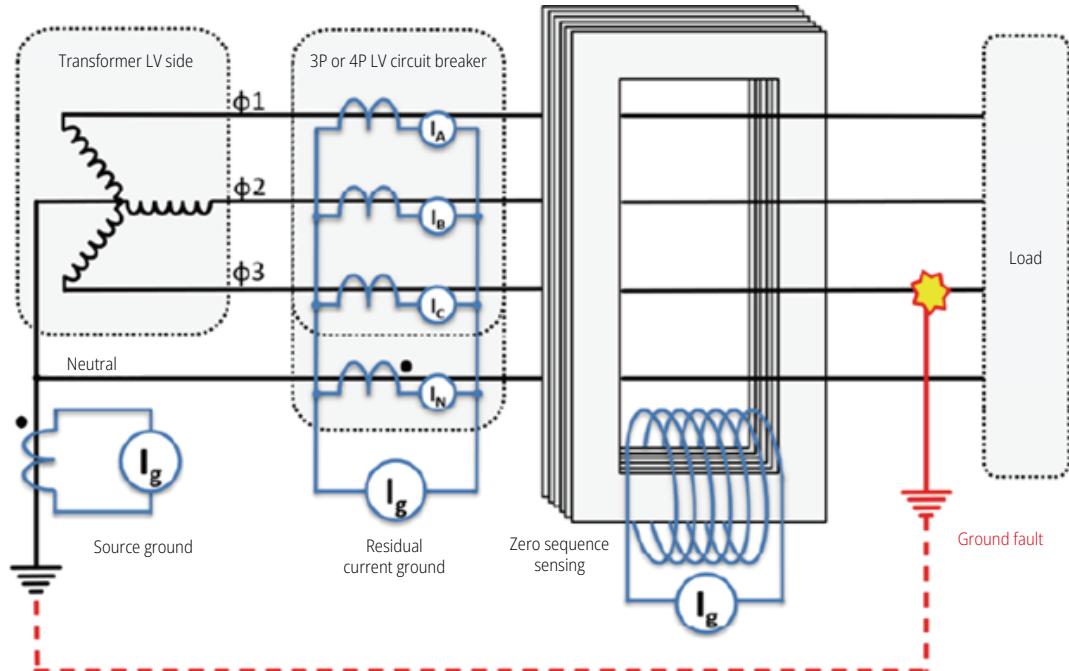

The PT unit provides for three modes of sensing to detect ground fault currents: Residual, Source Ground, and Zero Sequence. Refer to below ground methods for more description.

The ground sensing mode (Residual or Source/Zero Sequence) is selected using the display and navigation buttons or by using the PTM software.

Neutral protection is provided independent of the Ground Fault function.

Ground fault alarm or trip can be output via programmable relays.

Ground Method Description

Residual Current Grounding

Residual current sensing is the standard mode of ground fault sensing in Series PT trip units. This mode uses one current sensor on each phase conductor and one on the neutral for a four-wire system. This mode of sensing calculates the sum of vector outputs of the three or four current sensors. If the sum is zero, then no ground fault exists. Residual current ground sensing features are adaptable to main and feeder circuit breaker applications. If an external neutral sensor is used with a reverse feed breaker, the proper polarity of the neutral needs to be considered.

An external current sensor is required when a 3-pole circuit breaker performs residual current grounding sensing.

Source Grounding and Zero Sequence Grounding

The current sensor (4000:1) signal on the ground wire of the source ground receiving device directly measures the total ground current flowing through the ground conductor. When the current measured by the trip unit exceeds the ground fault setting, the circuit breaker will trip or alarm.

The ground return detection method is usually applied when the main circuit breaker is used for a simple one-way power system. This method is also applicable to double-ended systems where a mid-point grounding electrode is employed.

Setting the ground fault type will enable this protection.

Zero Sequence sensing, also referred to as vectorial summation, is applicable to mains, feeders, and special schemes involving zone protection.

The Zero Sequence sensing method uses a single sensor that contains all phase and neutral wires in a four-wire system. If a ground fault occurs, the vector sum of all magnetic fields will not be zero, and the sensor will produce an output signal equivalent to the current flowing to ground. When the current measured by the trip unit exceeds the time delay ground fault setting, the circuit breaker trips or alarms.

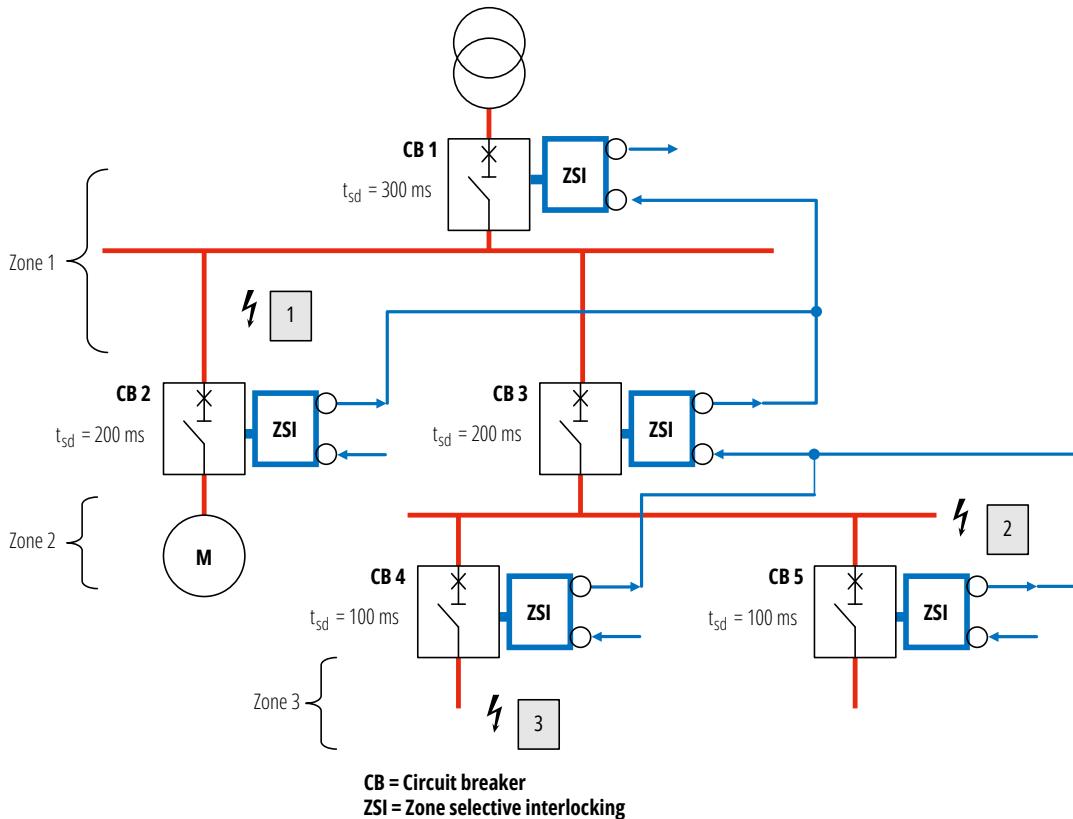

The sensors used in both sensing methods are iron-core CTs, connected to frame secondary wiring terminals G1 and G2. The sensor ratio must be adapted to the trip unit of 4000:1A.

The starting current for both the return Source ground and Zero Sequence ground are multiples of 400.

IZM6 Series Air Circuit Breakers

Trip Unit Functions

Zone Selective Interlocking (ZSI)

Zone Selective Interlocking (ZSI)

- The zone selective interlocking (ZSI) does not require additional function modules to operate. ZSI can be achieved by connecting the circuit breakers through a set of cables. The ZSI function ensures the upstream circuit breaker closest to the fault point to break the current quickly without any delay.
- The ZSI function significantly reduces breaking time to lower impact on the system due to short circuit, compared to conventional power systems that use different delay time to build selectivity.
- When the ZSI is enabled, a fault within the zone of protection will immediately trip the breaker and send a blocking signal to upstream trip units to restrain them from tripping immediately. The blocking signal causes the upstream circuit breakers to follow their set coordination time delays so that the service is interrupted to the isolated fault area only while the fault is cleared in the shortest time possible.

Zone Selective Interlocking (ZSI) Examples

Example A – Short circuit at Position 3

- Circuit Breakers CB1, CB3 and CB4 all see the short circuit current and actuate a short delay pickup.
- Circuit Breaker CB4 sends a ZSI output blocking signal to CB3 ZSI input. CB3 sends a ZSI output blocking signal to CB1 ZSI input. CB1 sends a ZSI output signal that is not wired. This signal could be wired to a medium-voltage relay on the other side of the transformer with a compatible ZSI model.
- CB1 receives the ZSI input signal and starts a timer for 300ms. CB3 receives the ZSI input signal and starts its timer for 200ms. CB4 gets no input from any lower zone circuit breaker. This circuit breaker will then trip immediately without any time delay. CB4 interrupts the fault and CB1 and CB3 stop short delay timing because the fault current is gone.
- If for some reason, CB4 does not open and interrupt the fault, then at the end of its short delay time CB3 will open and interrupt the fault.

Example B – Short circuit at Position 2

- Circuit Breaker CB1 and CB3 see the short circuit current and actuate a short delay pickup. CB4 and CB5 do not see the fault current and do not send a ZSI output.
- Circuit Breaker CB3 sends a ZSI blocking signal to CB1 ZSI input. CB1 sends a ZSI output signal. In this example, that signal is not wired.
- CB1 received the ZSI input signal and starts a timer for 300ms. CB3 gets no input from any lower zone circuit breaker. This breaker will then trip immediately without any time delay. CB3 interrupts the fault and CB1 stops short delay timing because the fault current is gone. With the ZSI function, the clearance time is reduced by approximately 150ms.

Example C – Short circuit at Position 1

- Only Circuit Breaker CB1 sees the short circuit current and actuate a short delay pickup. CB2, CB3, CB4 and CB5 do not see the fault current and do not send ZSI outputs.
- CB1 sends a ZSI output signal. In this example that signal is not wired.
- CB1 gets no input from any lower zone circuit breaker. This breaker will then trip immediately without any time delay. CB1 interrupts the fault and the clearance time is reduced by approximately 250ms.

Making Current Release (MCR)

All PT unit styles have a Making Current Release (MCR) function. This safety feature prevents the circuit breaker from being closed and latched-in on a faulted circuit. The MCR is enabled only for the first two cycles of current following the initial circuit breaker closing operation. The circuit breaker will trip with no delay and the instantaneous ("INST") indicator will blink.

High Instantaneous Protection

The PT unit provides a high instantaneous trip function that will trip the circuit breaker at the withstand current rating. This function is factory set within the frame module and reacts to the peak current. It is always active regardless of the user's instantaneous adjustment selection, including "OFF". The instantaneous ("INST") indicator shows this cause of trip.

Modbus Communication

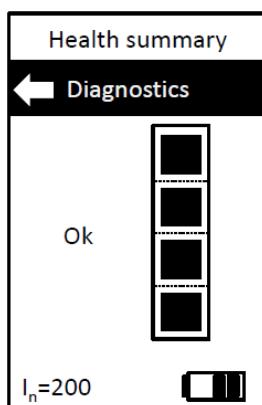

A Modbus communication port is integrated for certain trip unit styles. This provides communication from the trip unit to a field Modbus bus network.

When powered, the trip unit will be able to communicate via the secondary terminals, labeled MODBA (6), MODBB (17), and MODBG (18) as a slave device. Recommended Modbus cable has shielded twisted-pair wires.

Circuit Breaker Health Diagnosis

The PT unit includes a new algorithm to monitor the health of the circuit breaker. The parameters monitored by the algorithm include short circuit, over load, operation, temperature, and operating time. The combination of all these parameters provides an overall picture of the circuit breaker condition and can be used for preventive maintenance and improved system reliability.

- The health of the circuit breaker is represented by the health percentage. A circuit breaker reports 100% health corresponding to 100% remaining service life.
- The circuit breaker health values can be used to set the health alarm threshold, ranging from 0% to 50%, with the adjustable step of 1%.
- The health values can be viewed through the PTM software, which can also be mapped into a configurable relay. These values can be viewed on the screen for PT20/25 devices.

Advanced Protections (PT20/25 Only)

The PT20/25 provides a set of advanced protection features that can be configured to OFF (by default), Alarm or Trip.

Over Voltage Protection

The trip unit continuously monitors the line voltage rms values (Vab, Vbc, Vca). If the line voltage at any phase is greater than the over voltage setting, and the corresponding delay time setting is exceeded, the trip unit will act (OFF, Alarm or Trip).

Under Voltage Protection

If the line voltage at any phase is lower than the under voltage setting, and the corresponding delay time setting is exceeded, the trip unit will act.

If both over voltage and under voltage protections are enabled, the under voltage setting should always be lower than the over voltage setting.

Phase Sequence Protection

The phase sequence protection can be set to positive sequence (A-B-C), or negative (A-C-B) sequence action. When the phase sequence of the three phase voltages is the same as the setting, the trip unit will act.

When the phase voltages of all three phases are greater than 100V, phase sequence metering will be activated.

Demand Protection

Current demand protection.

Current demand protection is a type of current protection mechanism for each phase. Different thresholds can be set for different phases (independent from each other), and the same time delay parameters are used for all three phases.

When the current of any of the three phases is greater than the protection threshold of that phase and the corresponding time delay setting is reached, the trip unit will act.

Power demand protection (PT25 only)

When the detected active power is greater than the defined power demand setting, and the corresponding time delay setting is reached, the trip device will act.

Frequency Protection

Over frequency protection: When the frequency detected by the trip unit exceeds the over frequency setting, and the corresponding time delay setting is exceeded, the trip device will act.

Under frequency protection: If the frequency detected by the trip unit is lower than the under frequency setting and the corresponding time delay setting is exceeded, the trip unit will act.

When Phase A's phase voltage is greater than 100V, the frequency protection will be activated.

Voltage Unbalance

If the difference between the maximum and minimum values of the line voltage in three phases is greater than the voltage unbalance's voltage setting, and the corresponding time delay setting is exceeded, the trip unit will act.

Voltage unbalance protection is effective only when the line voltage in at least one phase is greater than 84V.

Current Unbalance

The trip unit continuously monitors the rms current value of each item (Ia, Ib, Ic).

IZM6 Series Air Circuit Breakers

Trip Unit Functions

Unbalance protection prevents partial or complete absence of current in one or two phases. If the difference between the maximum and minimum values of the three-phase current is greater than the current unbalance's current setting, and the corresponding time delay setting is exceeded, the trip unit will act.

Notes: Current unbalance protection is effective only when at least one phase current is greater than 50% of the long delay pickup (LDPU or I_{n}) value.

Advanced Protection Features (PT25 only, unless Specified)

Protection		Unit	Setting	Note
Voltage Protection	Over-voltage Pickup	V	180-720 adjustable	Interval of 1
	Over-voltage Delay	s	1~ 300 adjustable	Interval of 1
	Under-voltage Pickup	V	60-670 adjustable	Interval of 1
	Under-voltage Delay	s	1- 300 adjustable	Interval of 1
	Voltage Unbalance Pickup	% V	5- 25 adjustable	Interval of 1
	Voltage Unbalance Delay	s	1- 300 adjustable	Interval of 1
Current Protection	Current Unbalance Pickup	% A	5- 25 adjustable	Interval of 1
	Current Unbalance Delay	s	1- 300 adjustable	Interval of 1
	Phase Loss Pickup	% A	75	
	Phase Loss Delay	s	1- 240 adjustable	Interval of 1
Power Protection	Reverse Power Pickup	kW	1- 65500 adjustable	Interval of 1
	Reverse Power Delay	s	1- 300 adjustable	Interval of 1
Frequency Protection	Over-frequency Pickup	Hz	40- 70 adjustable	Interval of 1
	Over-frequency Delay	s	0.2- 5 adjustable	Interval of 0.1
	Under-frequency Pickup	Hz	40- 70 adjustable	Interval of 1
	Under-frequency Delay	s	0.2- 5 adjustable	Interval of 0.1
Phase Sequence Protection	Positive Sequence (A-B-C)		3-phase voltage sequence is the same as the setting, and the trip unit acts	
	Reversed Sequence (A-C-B)			
Demand Protection	Current Demand Pickup	x (I_{n})	0.2-1.0 adjustable	Interval of 0.1
	Current Demand Delay	s	15-1500 adjustable	Interval of 1
	Power Demand Pickup	kW	1- 65500 adjustable	Interval of 1
	Power Demand Delay	s	15-1500 adjustable	Interval of 1

Relays and Digital Inputs (PT25 only)

Relay Configuration

There are 3 relay modules integrated in the PT25 unit which are used to indicate status information to other systems. All relays in the PT unit can be configured to any conditions in below table. Configuration is conveniently done using the PTM software. Relays require an auxiliary power to operate.

Function name	Description of relay operation "The relay will close when..."	Description of relay operation "The relay will open when"
Overload Trip	There is a long or over-temperature trip	RESET button is pressed or communications reset command received
Neutral Trip	There is a neutral current trip	RESET button is pressed or communications reset command received
Short Delay Trip	There is a short delay trip	RESET button is pressed or communications reset command received
Instantaneous Trip	There is an instantaneous trip or mcr trip	RESET button is pressed or communications reset command received
Short Circuit Trip	There is a short, inst or high inst trip	RESET button is pressed or communications reset command received
Ground Fault Trip	There is a ground fault trip	RESET button is pressed or communications reset command received
All Trips	Any of protective trip (overload, neutral, short delay, instantaneous, ground)	RESET button is pressed or communications reset command received
High Load 1	Current flow is greater than set point (adjustable from 50% to 120% of i_{t})	Current flow falls 5% below the set point
High Load 2	Current flow is greater than set point (adjustable from 50% to 120% of i_{t})	Current flow falls 5% below the set point
Over Temperature Alarm	Temperature exceeds 5°C below the level of the temperature trip setting	Temperature falls 5°C below the setting
Ground Fault Early Warning	Ground current is greater than the set point (adjustable from 50% to 100%)	Ground current falls 5% below the set point
Thermal Memory	The thermal memory value is greater than set point (adjustable from 50% to 100%)	Thermal Memory falls 5% below the set point
Watchdog	Auxiliary power is active and the trip unit is healthy and operating	there is an error detected in the trip unit from any of the self-diagnostics
Low Battery	The battery is below 1 bar (20%)	the battery value is 1 bar (20%) or higher
Internal (HW) Fault	There is an internal fault detected	RESET button is pressed or communications reset command received
Setpoint Mismatch	A setpoint in the trip unit does not match the cam's configuration	RESET button is pressed or communications reset command received
Breaker Health Alarm	The health value is at or above the set point	the health value is below the set point
Communication Error	Any external communications error occurs	RESET button is pressed or communications reset command received
All Faults	Any of internal fault, setpoint mismatch, breaker health alarm, or communication error faults	All of internal fault, setpoint mismatch, breaker health alarm, or communication error are inactive
Aux Contact	Breaker is closed	Breaker is open
Trip Contact	Breaker is tripped	Breaker is not tripped (it is open or closed)
ZSI Active	The zsi function active	ZSI is not active
ZSI Input Received	A zsi input signal is received	RESET button is pressed or communications reset command received
ZSI Output Sent	A zsi output signal is sent	RESET button is pressed or communications reset command received
Open Breaker Pulse	An open breaker command from any of the communications channels is received	2 seconds after the OPEN breaker command is received
Close Breaker Pulse	A close breaker command from any of the communications channels is received	2 seconds after the CLOSE breaker command is received
Mechanical Fault Trip	A mechanical fault occurs and is disengaged, the mechanism position is in the open position, but there is measurable current	The fault is removed
Mechanical Fault Alarm	A mechanism fault alarm occurs (ta fault, mechanism open, but there is measurable current)	Relevant fault is removed
Electrical Fault Alarm	Electrical fault (configuration reading errors, clock faults, watchdog faults, breaker health alarm) alarm has occurred	Relevant fault is removed
Over-voltage Trip	Over-voltage trip is active and over-voltage trip has occurred	RESET button is pressed or communications reset command received
Over-voltage Alarm	Over-voltage alarm is active and over-voltage alarm has occurred	RESET button is pressed or communications reset command received
Under-voltage Trip	Under-voltage trip is active and under-voltage trip has occurred	RESET button is pressed or communications reset command received
Under-voltage Alarm	Under-voltage alarm is active and under-voltage alarm has occurred	RESET button is pressed or communications reset command received
Over-frequency Trip	Over-frequency trip is active and over-frequency trip has occurred	RESET button is pressed or communications reset command received
Over-frequency Alarm	Over-frequency alarm is active and over-frequency alarm has occurred	RESET button is pressed or communications reset command received
Under-frequency Trip	Under-frequency trip is active and under-frequency trip has occurred	RESET button is pressed or communications reset command received
Under-frequency Alarm	Under-frequency alarm is active and under-frequency alarm has occurred	RESET button is pressed or communications reset command received
Voltage Unbalance Trip	Voltage unbalance trip is active and voltage unbalance trip has occurred	RESET button is pressed or communications reset command received
Voltage Unbalance Alarm	Voltage unbalance alarm is active and voltage unbalance alarm has occurred	RESET button is pressed or communications reset command received
Current Unbalance Trip	Current unbalance trip is active and current unbalance trip has occurred	RESET button is pressed or communications reset command received

IZM6 Series Air Circuit Breakers

Trip Unit Functions

Relay Configuration (Continued)

Function name	Description of relay operation "The relay will close when..."	Description of relay operation "The relay will open when"
Current Unbalance Alarm	Current unbalance alarm is active and current unbalance alarm has occurred	RESET button is pressed or communications reset command received
Reverse Power Trip	Reverse power trip is active and reverse power trip has occurred	RESET button is pressed or communications reset command received
Reverse Power Alarm	Reverse power alarm is active and reverse power alarm has occurred	RESET button is pressed or communications reset command received
Phase Sequence Trip	Phase sequence trip is active and phase sequence trip has occurred	RESET button is pressed or communications reset command received
Phase Sequence Alarm	Phase sequence alarm is active and phase sequence alarm has occurred	RESET button is pressed or communications reset command received
Phase Loss Trip	Phase loss trip is active and phase loss trip has occurred	RESET button is pressed or communications reset command received
Phase Loss Alarm	Phase loss alarm is active and phase loss alarm has occurred	RESET button is pressed or communications reset command received
Power Demand Trip	Power demand trip is active and power demand trip has occurred	RESET button is pressed or communications reset command received
Power Demand Alarm	Power demand alarm is active and power demand alarm has occurred	RESET button is pressed or communications reset command received
OFF	Relay is disabled	Relay is disabled

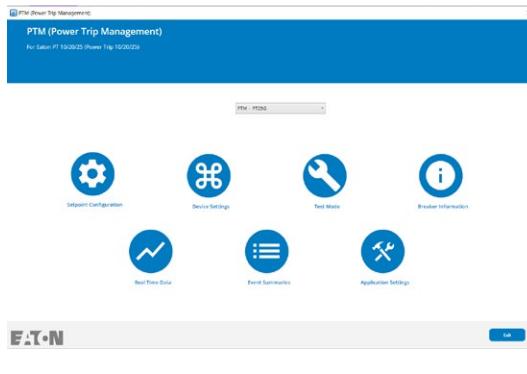

Digital Inputs (DI)

The PT25 trip unit supports 2 sets of 220VAC digital inputs. The corresponding status value will be written upon receiving external 220VAC signal inputs. The status value can be read via Modbus communication or through the PTM software.

Power Trip Management (PTM) Software

Eaton's Power Trip Management (PTM) is a Microsoft® Windows-based software that configures, controls, monitors, and tests Eaton PT series trip units.

The software is available as a download from the following link: <http://www.eaton.com.cn/PTM>

The PTM software supports below key functions:

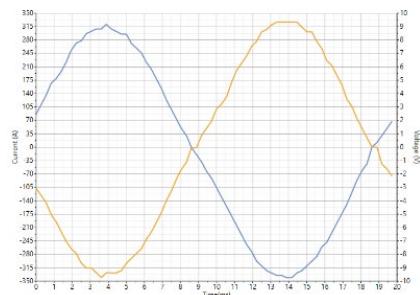

Read / Change / Copy Circuit Breaker Settings and Protections

Circuit breaker parameters can be read, changed, and loaded via PTM. The setup parameters of the trip unit can be also copied to another trip unit.

Waveform Capture

The PT unit allows users to manually capture current and/or voltage waveforms. To capture waveforms, click the Capture Waveform button. The PT unit will then capture a complete waveform cycle and transfer it to the PTM software for display.

Testing the Circuit Breaker and Trip Unit

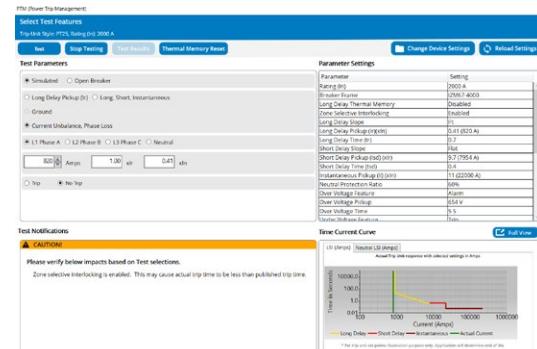

Testing conducted via PTM enables technicians to drastically reduce the number of events required for testing, make maintenance easier, and produce test reports easily.

The PTM software is used to control testing of long delay trip, short delay trip, instantaneous trip, current unbalance and phase loss, as well as ground (earth) fault trip via the USB communication. The software allows for testing on any phase including neutral.

The PT unit has internal simulated current test and internal secondary injected current test. Both test modes can be configured for tripping or not tripping the circuit breaker.

Simulated tests make it easy to verify multiple points on the event current curve, and the test current values can be simulated under software algorithms to accurately verify the accuracy of the trip unit.

Circuit breaker opening test allows users to verify mechanical functionality of their circuit breakers. In addition, the test is able to check the tripping status of the circuit breaker of the device.

Event Recording

Up to 200 event records can be stored, with detailed information on the latest 10 trip events and 10 alarm events, stamped with real-world time.

Report Generation and Storage

Circuit breaker real-time data and time records can be printed. Customer name, location, environment, device situation can be entered before the report is printed. One document can report all test results, or annual inspection results.

IZM6 Series Air Circuit Breakers

Ordering Description

Devices supplied as standard:

Withdrawable circuit breaker's basic device, cassette, shunt release (220V AC), closing release (220V AC), motor operator (220V AC), auxiliary contact (4CO), PT intelligent trip unit, overcurrent trip switch OTS (1CO), door escutcheon, wiring terminal, 220V AC to DC24V power module, safety shutter, arc distinguishing cover, and handle.

PT10 Trip Unit Supplied as Standard - Current mode (Rotary Switch), Withdrawable Type

Current mode LSI

Devices supplied as standard:

Withdrawable circuit breaker's basic device, cassette, shunt release (220V AC), closing release (220V AC), motor operator (220V AC), auxiliary contact (4CO), PT intelligent trip unit, overcurrent trip switch OTS (1CO), door escutcheon, wiring terminal, 220V AC to DC24V power module, safety shutter, arc distinguishing cover, and handle.

PT25 Trip Unit Supplied as Standard - Power Mode (LCD), Withdrawable Type

IZM6 Series Air Circuit Breakers

Ordering Description

Devices supplied as standard:

Fixed circuit breaker's basic device, shunt release (220V AC), closing release (220V AC), motor operator (220V AC), auxiliary contact(4CO), PT intelligent trip unit, over current trip switch OTS (1CO), door escutcheon, wiring terminal, 220V AC to DC24V power module, arc distinguishing cover, and handle.

PT20 Trip Unit Supplied as Standard - Current mode (LCD), Fixed Type

IZM6 Series Air Circuit Breakers

Ordering Description

Devices supplied as standard:

PT25 Trip Unit Supplied as Standard - Power Mode (LCD), Fixed Type

Devices supplied as standard:

Withdrawable circuit breaker's basic device, cassette, shunt release (220V AC), closing release (220V AC), motor operator (220V AC), auxiliary contact (4CO), PT intelligent trip unit, overcurrent trip switch OTS (1CO), door escutcheon, wiring terminal, 220V AC to DC24V power module, safety shutter, arc distinguishing cover, and handle.

PT10 Trip Unit Supplied as Standard - Current mode (Rotary Switch), Withdrawable Type

IZM6 Series Air Circuit Breakers

Ordering Description

Manually Operated Devices Include:

Fixed circuit breaker's basic device, auxiliary contact (4CO), PT intelligent trip unit, over current trip switch OTS (1CO), door escutcheon, wiring terminal, 220V AC to DC24V power module, arc distinguishing cover, and handle.

PT20 Trip Unit Manually Operated - Current mode (LCD), Fixed Type

IZM6 Series Air Circuit Breakers

Ordering Description

Manually Operated Devices Include:

Withdrawable circuit breaker's basic device, cassette, auxiliary contact (4CO), PT intelligent trip unit, over current trip switch OTS (1CO), door escutcheon, wiring terminal, 220V AC to DC24V power module, safety shutter, arc distinguishing cover, and handle.

PT25 Trip Unit Manually Operated - Power Mode (LCD), Withdrawable Type

Izm6 Series Air Circuit Breakers

Ordering Description

Manually Operated Devices Include:

Withdrawable circuit breaker's basic device, cassette, auxiliary contact (4CO), PT intelligent trip unit, over current trip switch OTS (1CO), door escutcheon, wiring terminal, 220V AC to DC24V power module, safety shutter, arc distinguishing cover, and handle.

PT10 Trip Unit Manually Operated - Current mode (Rotary Switch), Withdrawable Type

Izm6 Series Air Circuit Breakers

Ordering Description

Manually Operated Devices Include:

Withdrawable circuit breaker's basic device, cassette, auxiliary contact (4CO), door escutcheon, wiring terminal, safety shutter, arc distinguishing cover, and handle.

Manually Operated Switch Disconnector, Withdrawable Type

Power Loss Table of External Auxiliary Contact

	Rated control voltage U_s (V)	Rated control capacity	Conventional thermal current I_{th} (A)
External auxiliary contact	AC230	800VA	16
	AC400		
	DC110	300W	
	DC220		

External Auxiliary Contact

The standard style of embedded auxiliary contacts provided in Izm6 is 4CO; when more than 4CO, external auxiliary contact will be needed, with the maximum number of 10CO. The external auxiliary contact cannot be equipped with mechanical interlocking.

IZM6 Series Air Circuit Breakers

Accessories

OFF Position Safety Lock

The OFF position safety lock can secure the opening button of the circuit breaker in the depressed position.

One lock and one key: A circuit breaker is equipped with one lock and one key. The circuit breaker is not allowed to close in the locked state.

Three locks and two keys: Three circuit breakers are equipped with three identical locks and two keys, and only two circuit breakers are allowed to close.

Lock type	For use with	Part No. Article No.	Part No. Article No. "+" means ordering together with the basic device

IZM6 Series Air Circuit Breakers

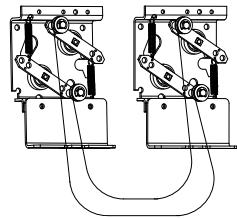

Accessories

Interphase Partition

The interphase partition is mounted vertically between the wiring boards in the fixed section of the withdrawable circuit breaker, to increase the insulation strength of the busbar connection and prevent the arc from spreading to the inside of the circuit breaker.

	For use with	Part No. Article No.
Withdrawable type		
	Interphase partition - 3-pole IZM61	IZM61C-IB-3¹⁾ CAM-51245
	Interphase partition - 4-pole IZM61	IZM61C-IB-4¹⁾ CAM-51246
	Interphase partition - 3-pole IZM65/67	IZM6C-IB-3-W CAM-51119

	Interphase partition - 3-pole IZM65/67	IZM6C-IB-3-F CAM-51121
	Interphase partition - 4-pole IZM65/67	IZM6C-IB-4-F CAM-51122

Notes:¹⁾ Can also be used for fixed circuit breakers.

Lever-In/Lever-Out Handle

	For use with	Part No. Article No.
	- IZM61	IZM61C-LT CAM-51251
	- IZM65/67	IZM6C-LT CAM-51126

Door Escutcheon

The door escutcheon is mounted on the door and features a protection level up to IP40. The circuit breaker offers an IP20 protection level when mounted separately. Corresponding door escutcheon is available for both fixed and withdrawable circuit breakers.

	For use with	Part No. Article No.
	Door escutcheon for withdrawable circuit breaker IZM61	IZM61C-DEG-W CAM-51249
	Door escutcheon for withdrawable circuit breaker IZM65/67	IZM6C-DEG-W CAM-51123
	Door escutcheon for fixed circuit breaker IZM61	IZM61C-DEG-F CAM-51250
	Door escutcheon for fixed circuit breaker IZM65/67	IZM6C-DEG-F CAM-51124

Vertical Main Wiring Terminals

Horizontal wiring is configured as standard for vertical main wiring terminals.

Wiring method	Rated current I_n A	Rated ultimate Switching capacity I_{cu} KA	Poles	For use with	Part No. Article No.
Vertical wiring	≤ 2500	≤ 66	3	IZM65	IZM6C-TV253 CAM-51127
Vertical wiring	≤ 2500	≤ 66	4	IZM65	IZM6C-TV254 CAM-51128

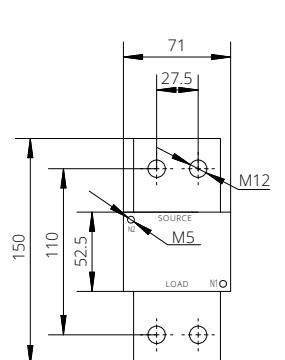

Power Module

IZM6 Series Air Circuit Breakers

Tripping Characteristics

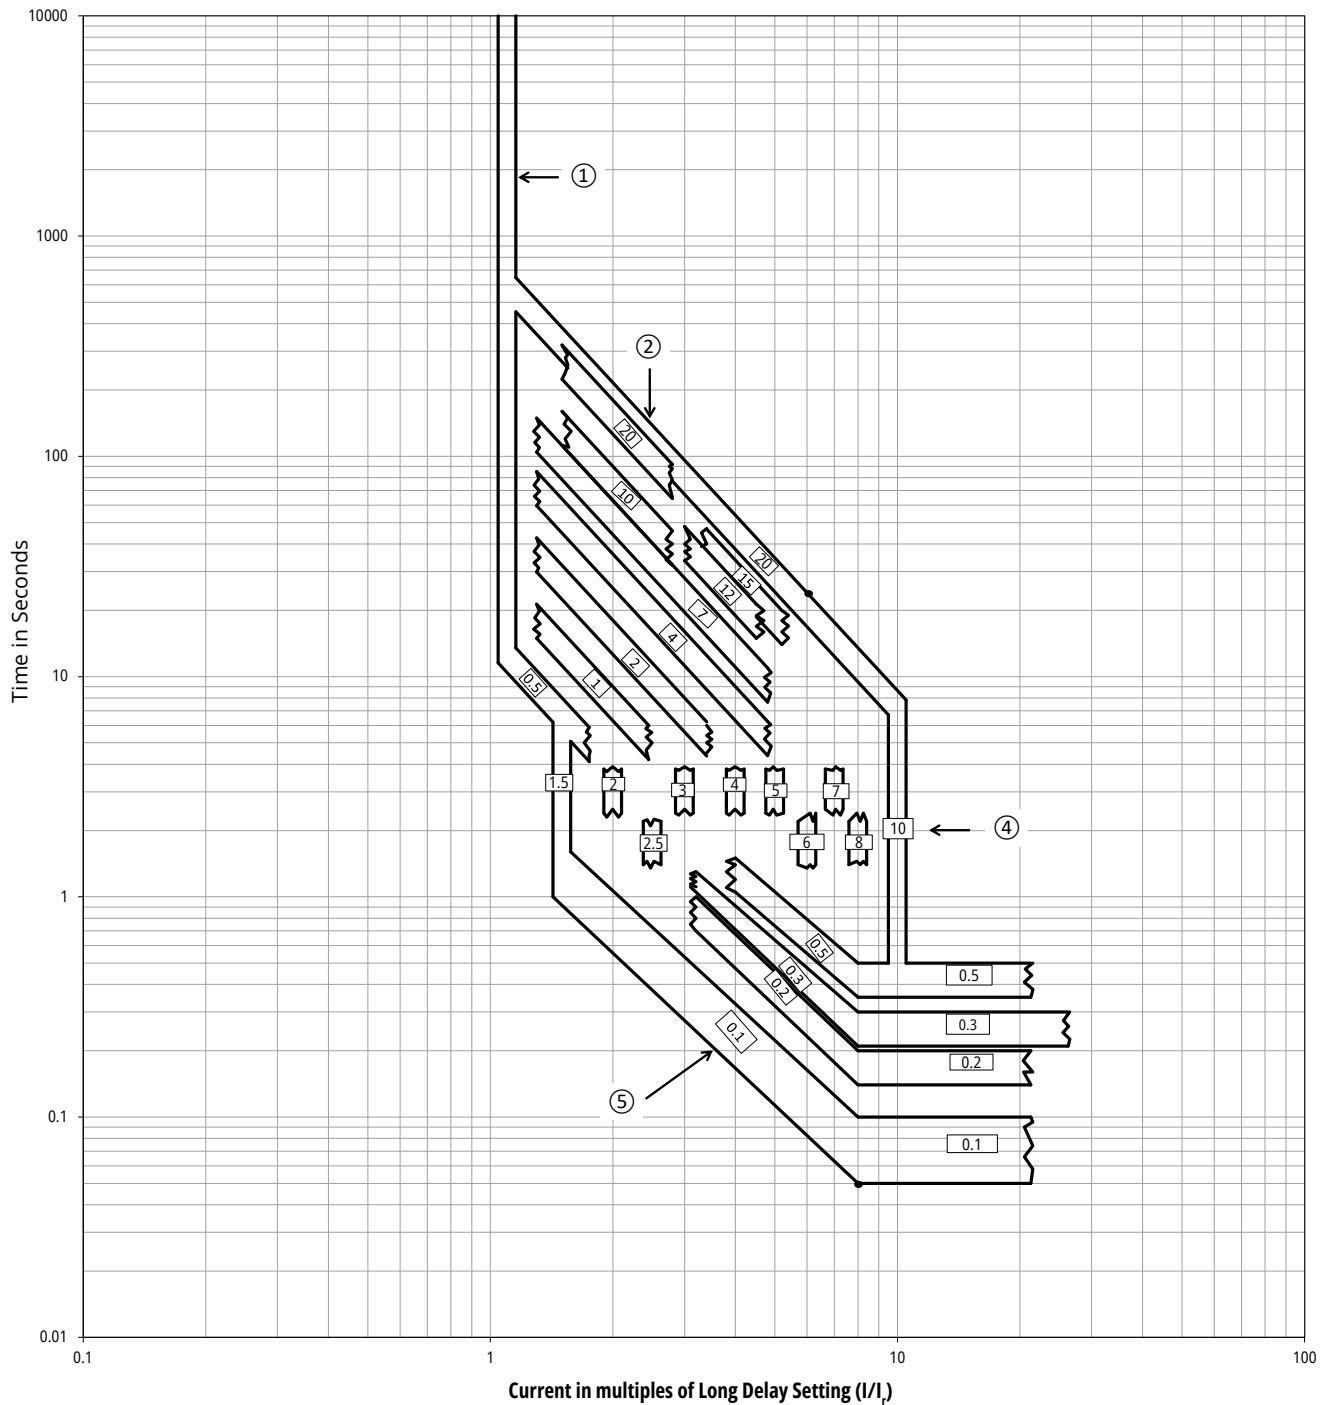

PT10 - Long Delay Protection with I^2t Curves and Short Delay Protection with Flat Curves

Notes:

1. Long delay I^2t slopes flattens out after 6x of I_L .
2. If Thermal Memory is enabled for long delay, trip times may be shorter than indicated in this curve.
3. Curves apply from -20°C to +50°C ambient. Temperature above 85°C will cause over temperature trip.
4. This curve is for 50hz or 60Hz applications.
5. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
6. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

PT10 - Long Delay Protection with I^2t Curves and Short Delay Protection with I^2t Curves

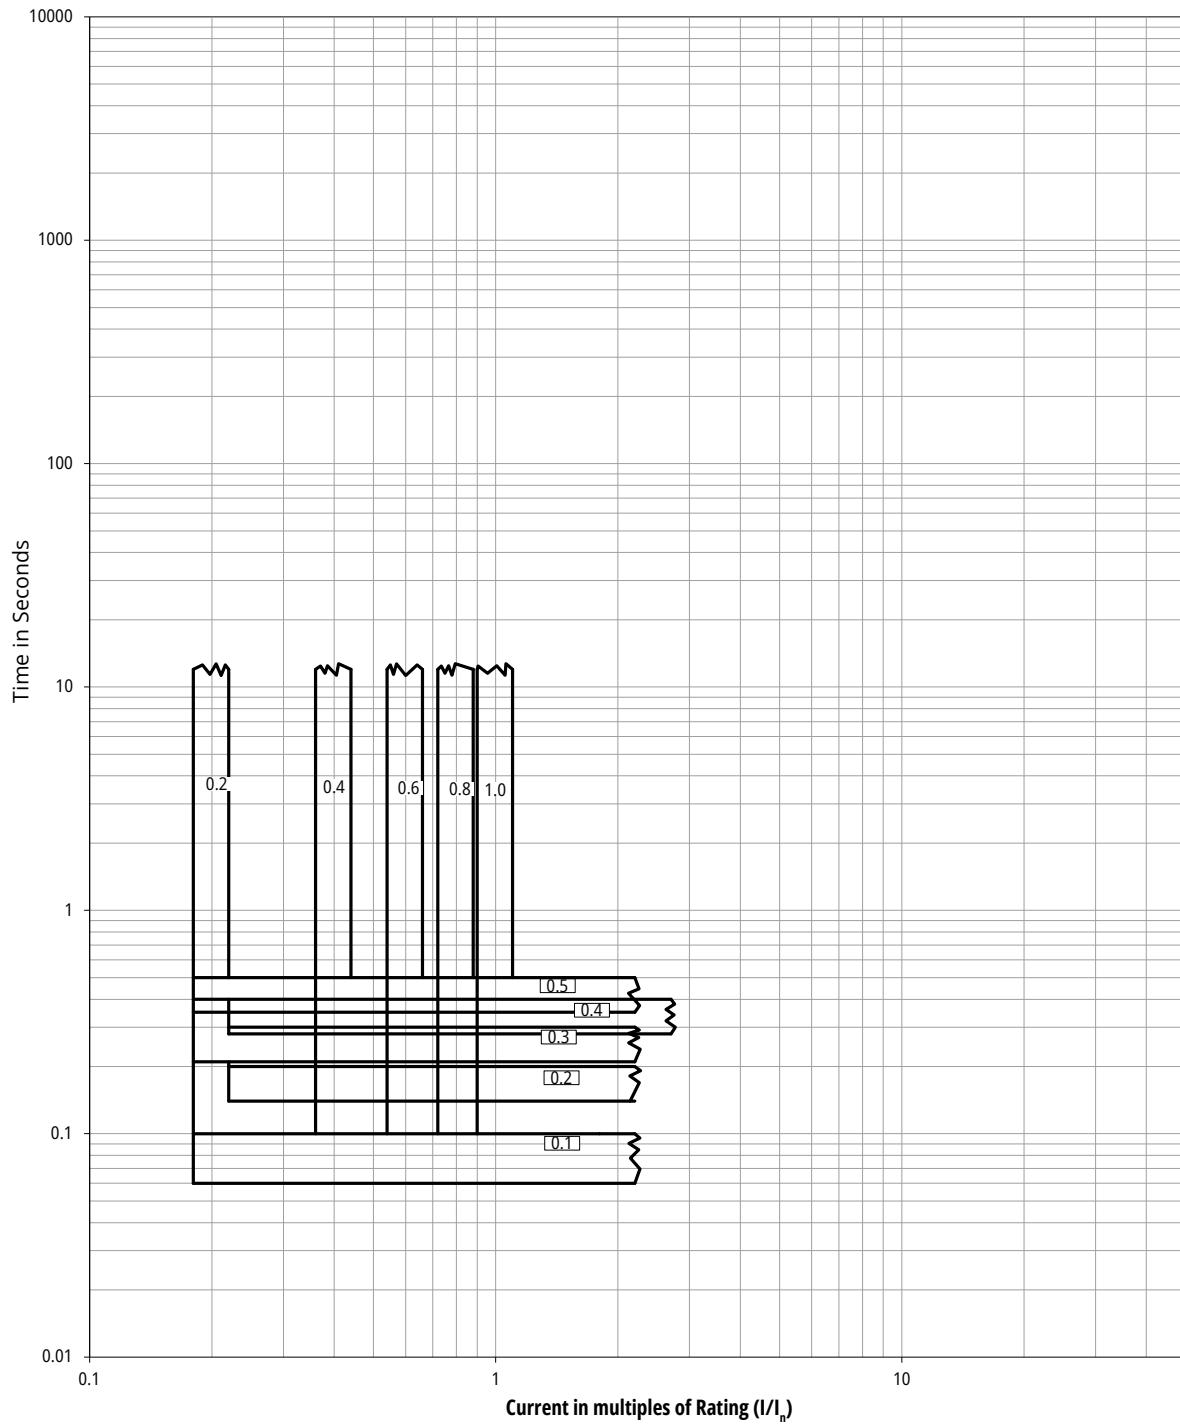

Notes:

1. Short delay pickup setting is 1.5x to 10x of I_r .
2. Long delay time = 0.5s to 24s, with +0/-30% accuracy.
3. Short delay slope is I^2t .
4. I^2t slopes intersect at 8x of I_r for top of band with FLAT time. The lower band flat response time value projected to I^2T line will determine the shape of the curve.
5. If Thermal Memory is enabled for long delay, trip times may be shorter than indicated in this curve.
6. Curves apply from -20°C to +50°C ambient. Temperature above 85°C will cause over temperature trip.
7. This curve is for 50Hz or 60Hz applications.
8. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
9. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

IZM6 Series Air Circuit Breakers

Tripping Characteristics

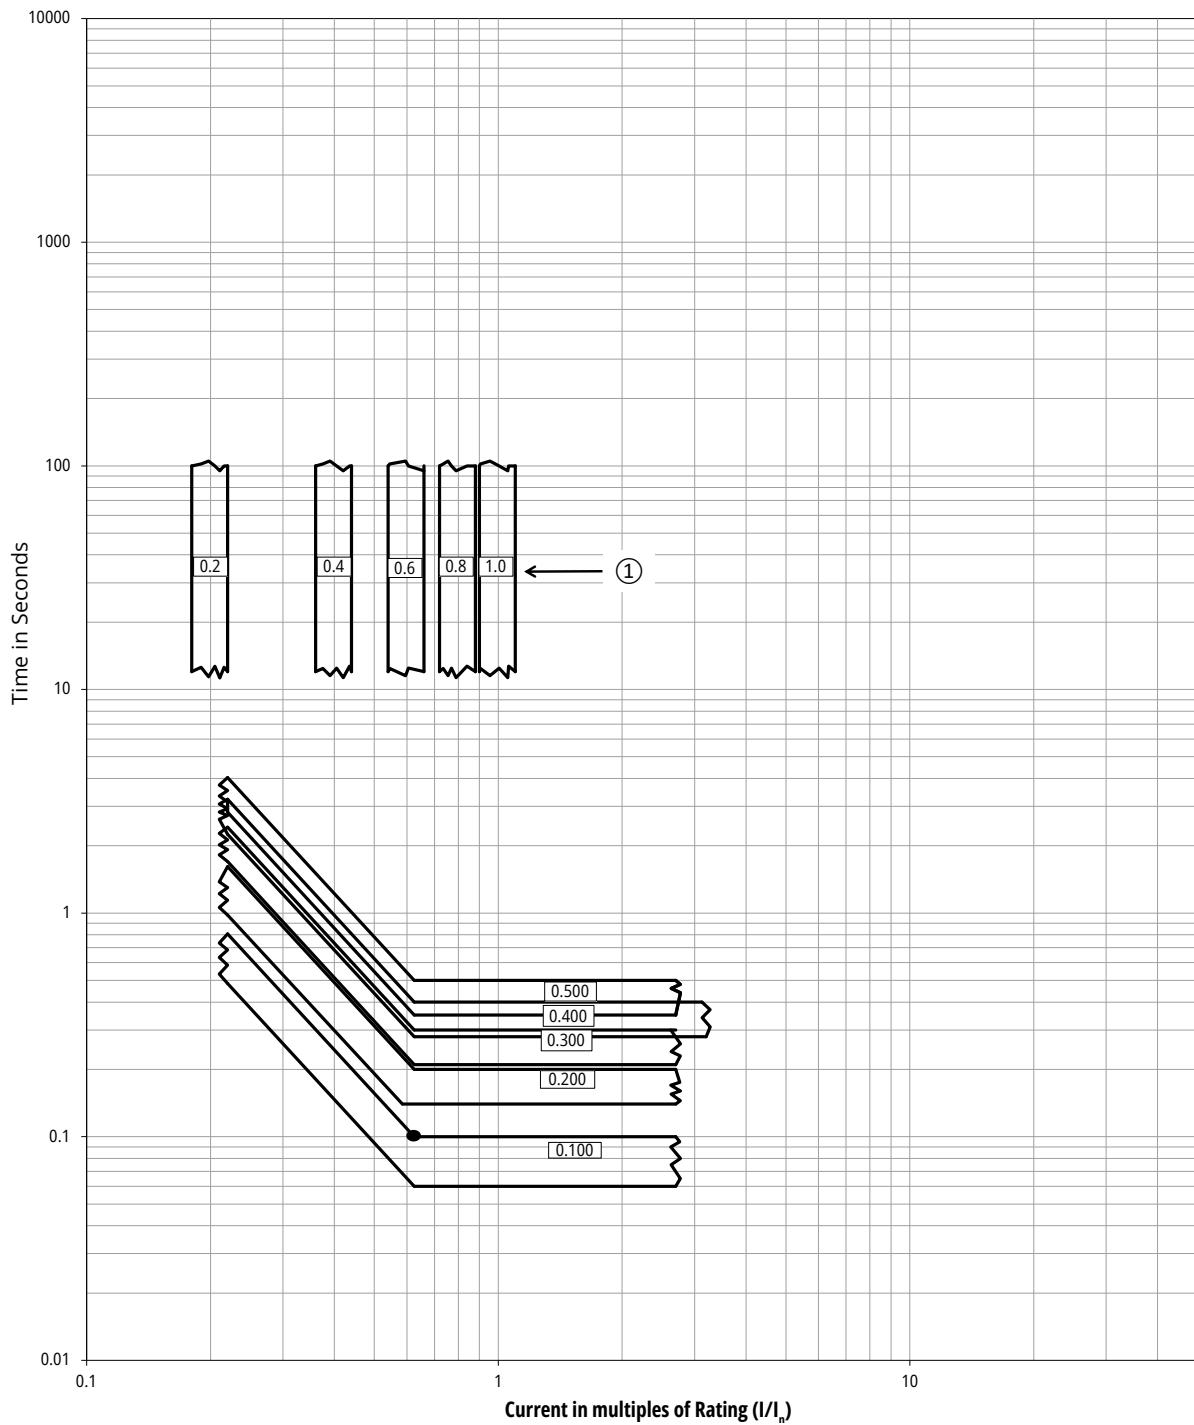

PT10 – Ground Protection with Flat Curves

Notes:

1. Ground pickup setting is 0.2 to 1 of I_n setting.
2. Ground Flat time setting is 0.1s to 0.5s.
3. Ground pickup setting is multiples of the Current Rating I_n .
4. The end of the curve is determined by the interrupting rating of the circuit breaker.
5. Curves apply from -20°C to +50°C ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C.
6. This curve is for 50Hz or 60Hz applications.
7. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
8. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

PT10 – Ground Protection with I^2T Curves

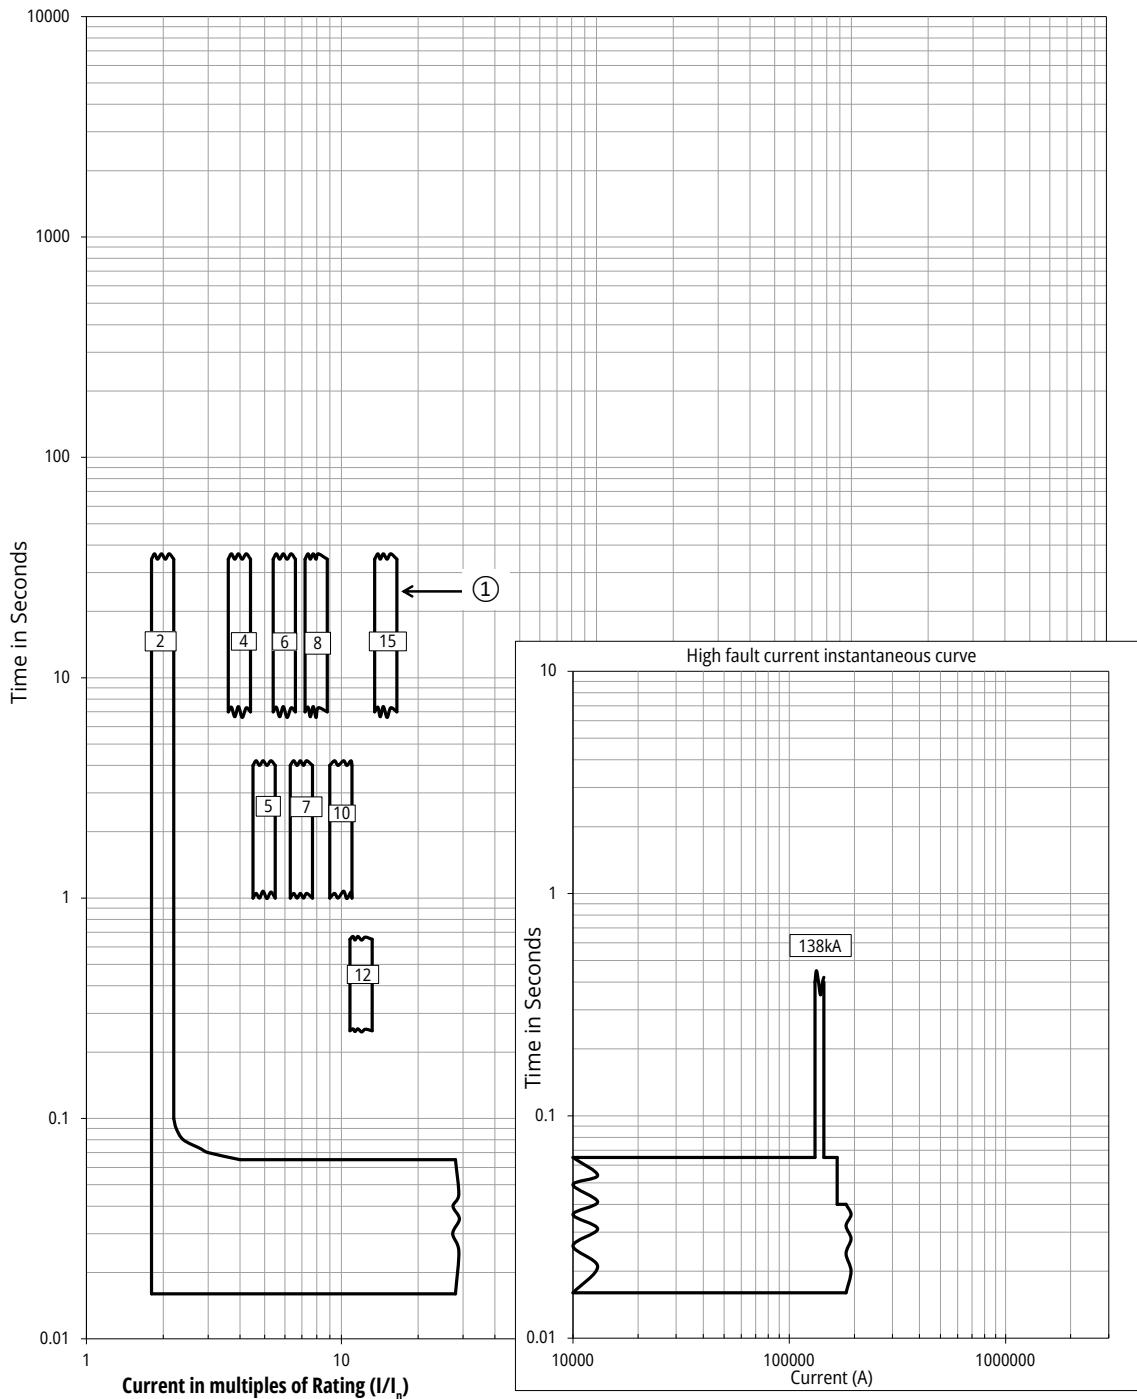

Notes:

1. Ground pickup setting is 0.2 to 1.0 of I_n .
2. Break points at $0.625 \times I_n$ to flat.
3. Ground I^2T time is 0.1s to 0.5s.
4. Ground pickup setting is multiples of the Current Rating I_n .
5. The end of the curve is determined by the interrupting rating of the circuit breaker.
6. Curves apply from -20°C to +50°C ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C.
7. This curve is for 50Hz or 60Hz applications.
8. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
9. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

IZM6 Series Air Circuit Breakers

Tripping Characteristics

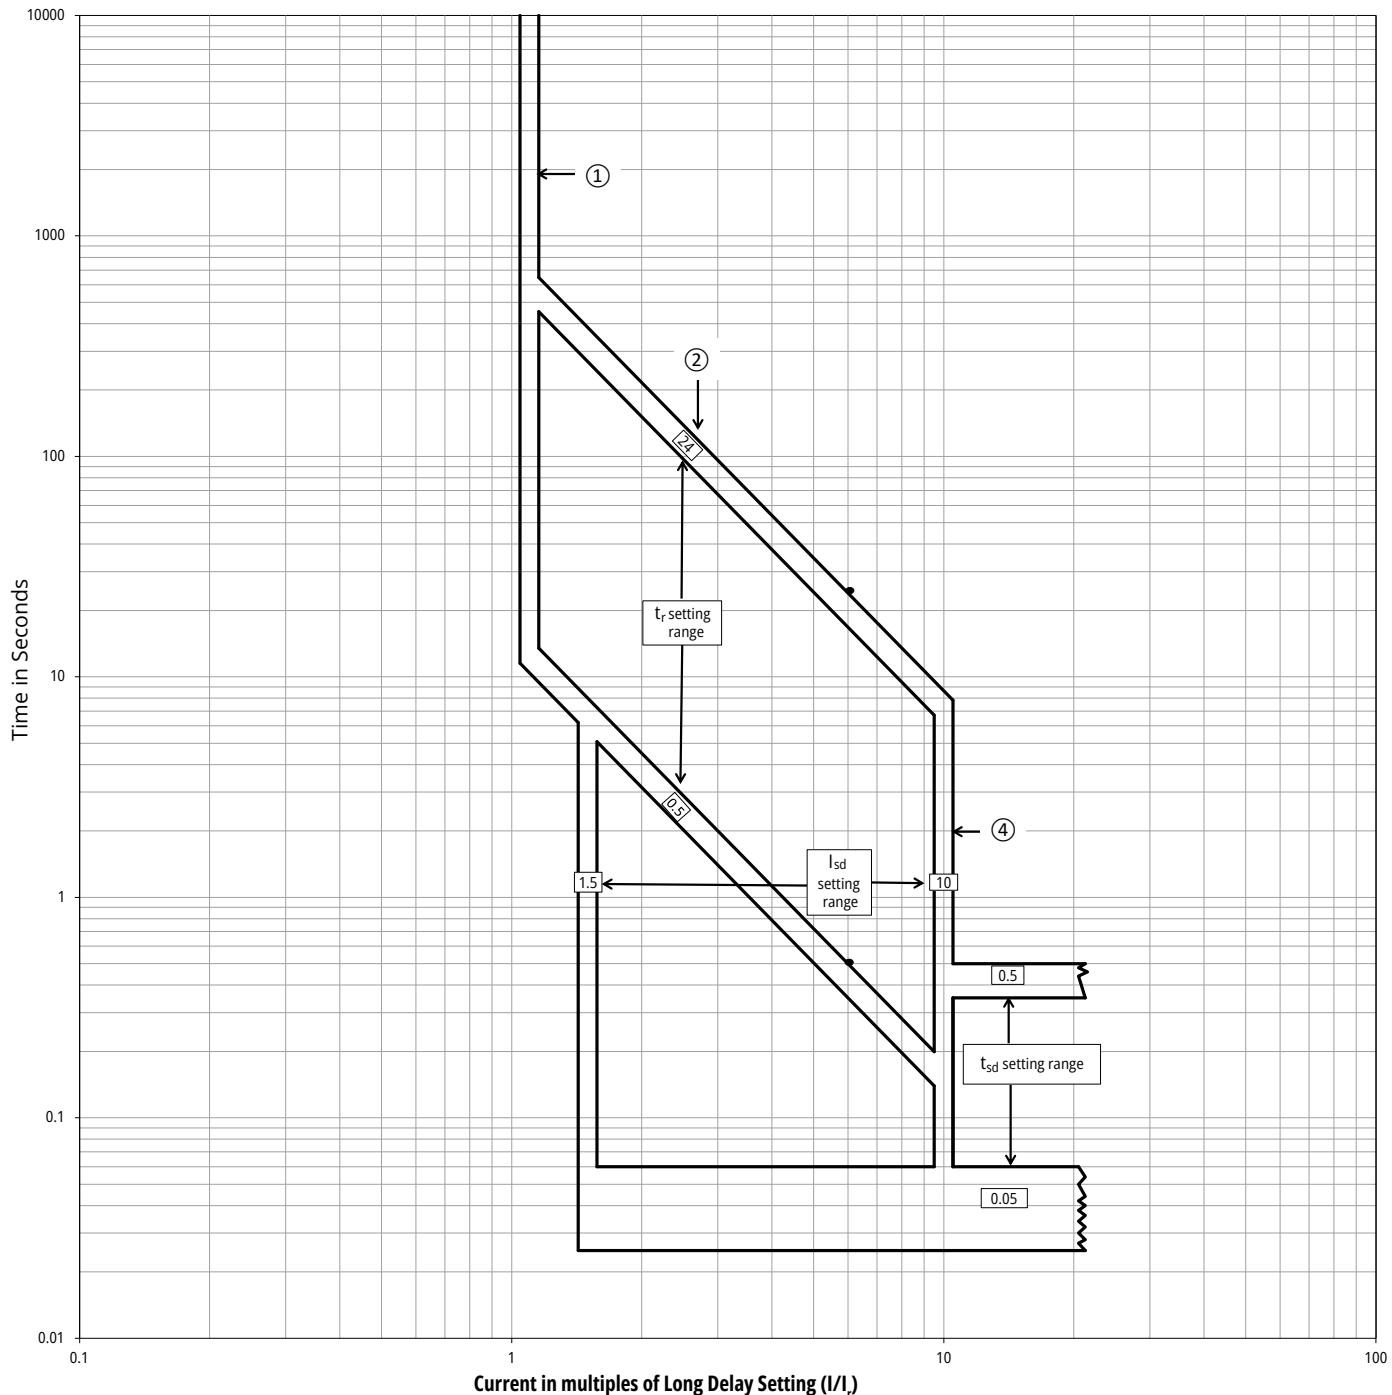

PT10 - Instantaneous Protection Curves

Notes:

1. Instantaneous protection can be disabled via rotary switch.
2. Instantaneous pickup setting is multiples of the Current Rating I_n .
3. The end of the curve is determined by the interrupting rating of the circuit breaker.
4. Curves apply from -20°C to $+50^\circ\text{C}$ ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C .
5. This curve is for 50Hz or 60Hz applications.
6. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.
7. Fixed High Instantaneous protection provided in IZM61 circuit breakers is set to pick up at 138kA.
8. This protection is functional even when the Instantaneous is set to the OFF position.
9. The PT unit will light the Instantaneous LED for a High Instantaneous protection action.
10. The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated current, single-phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions and settings.

PT20/25 – Long Delay Protection with I^2t Curves and Short Delay Protection with Flat Curves

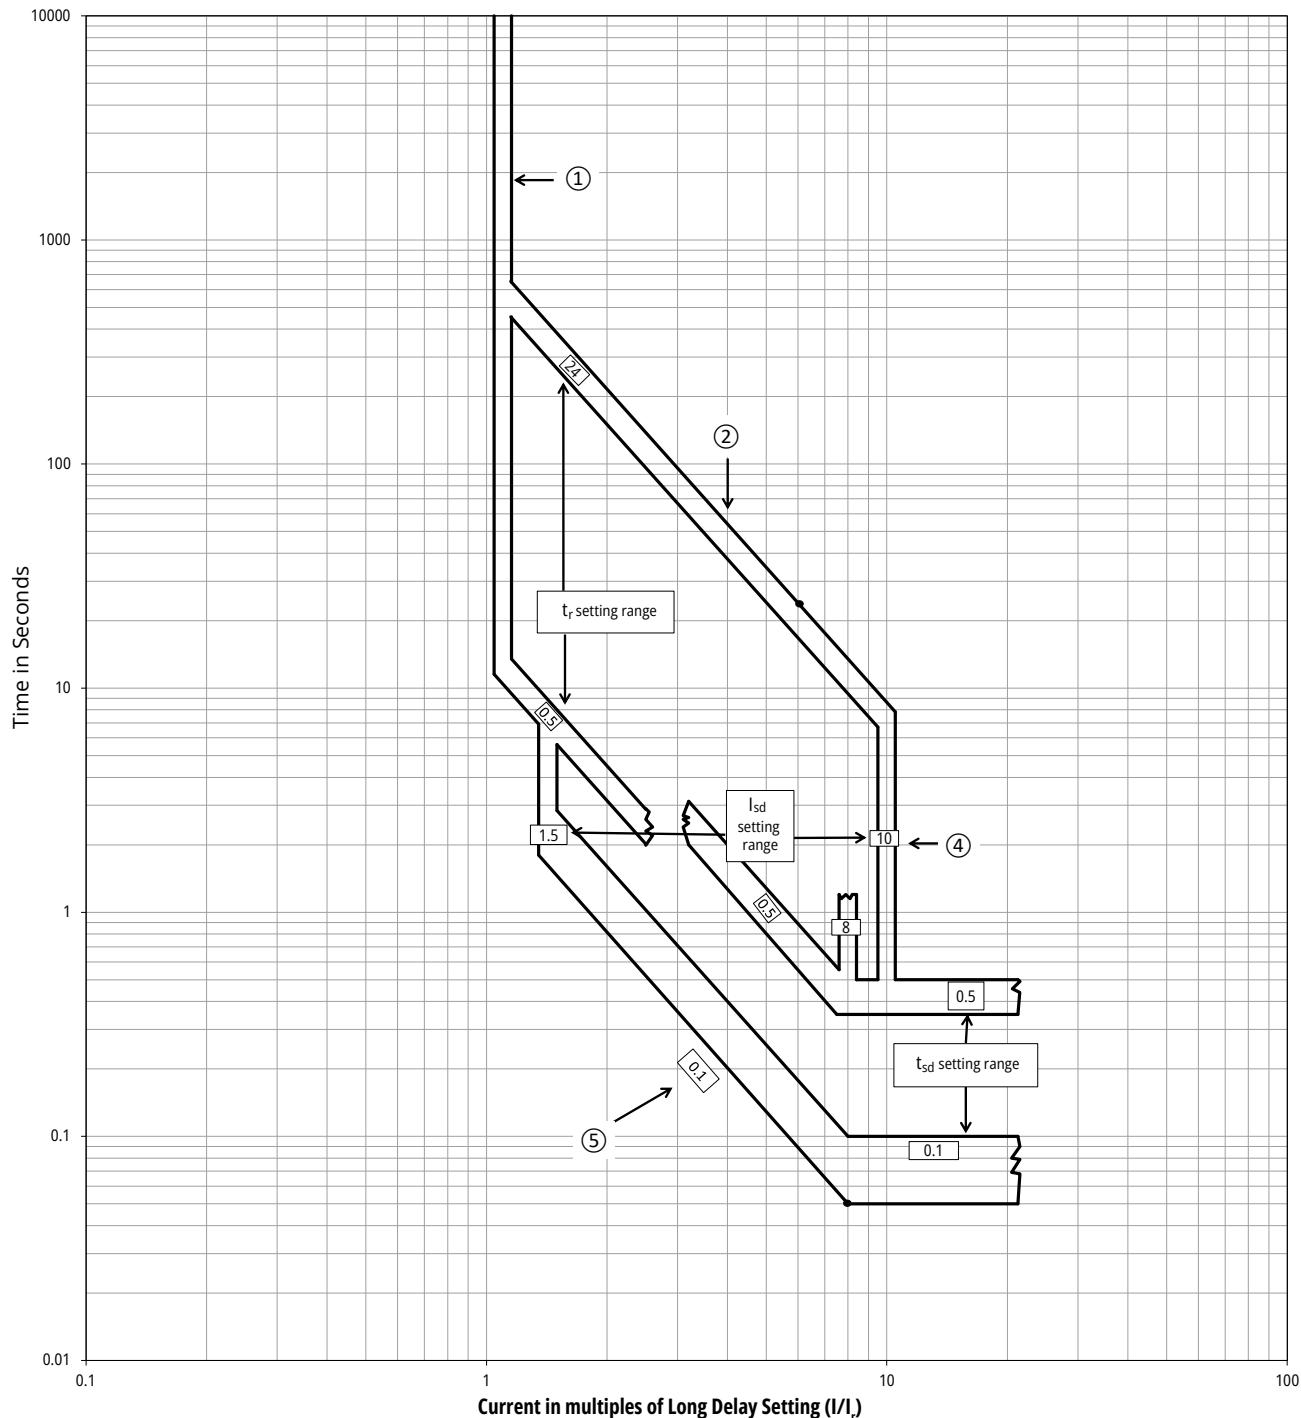

Notes:

1. Short Delay I^2t slopes flattens out after 6x of I_r .
2. If Thermal Memory is enabled for long delay, trip times may be shorter than indicated in this curve.
3. Curves apply from -20°C to +50°C ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C.
4. This curve is for 50Hz or 60Hz applications.
5. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
6. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

IZM6 Series Air Circuit Breakers

Tripping Characteristics

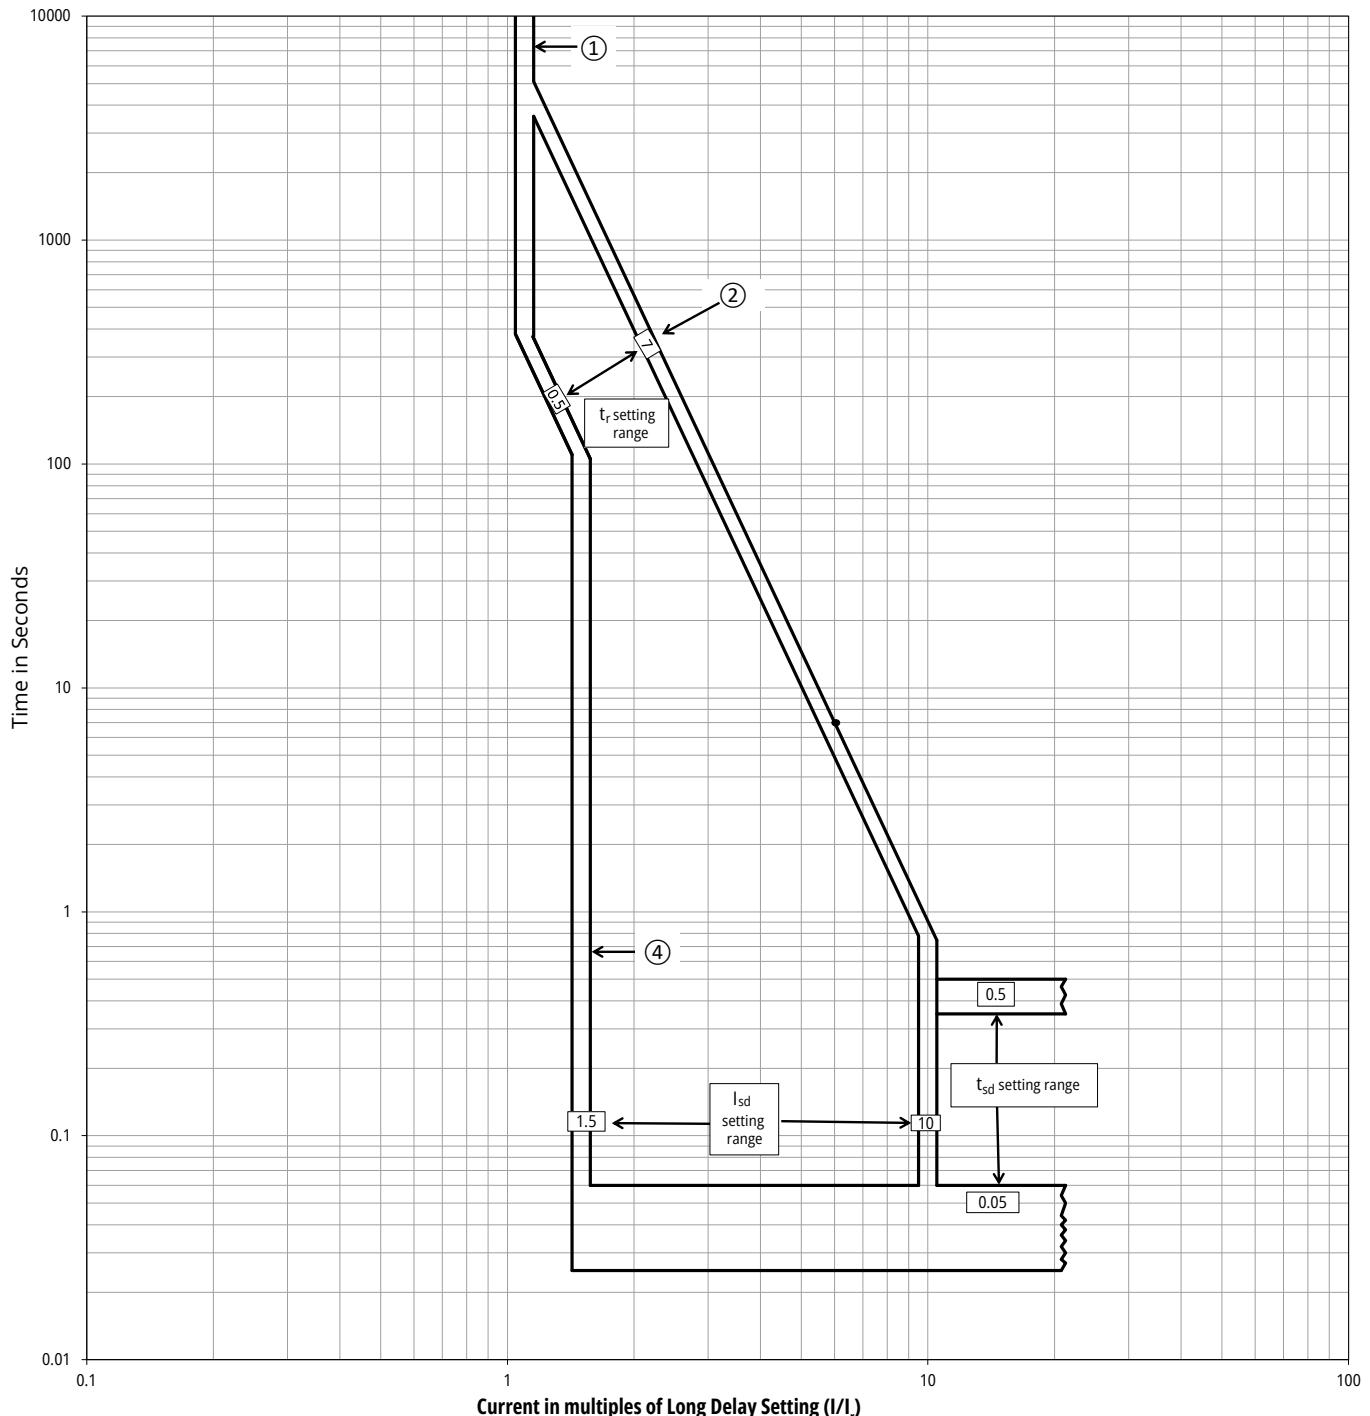

PT20/25 - Long Delay Protection with I^2t Curves and Short Delay Protection with I^2T Curves I^2

Notes:

1. Short Delay pickup setting is 1.5x to 10x of I_L .
2. Long Delay time setting is 0.5s to 24s, with +0/-30% accuracy.
3. Short delay slope is I^2t .
4. I^2t slopes intersect at 8x of I_L for top of band with FLAT time. The lower band flat response time value projected to I^2T line will determine the shape of the curve.
5. If Thermal Memory is enabled for long delay, trip times may be shorter than indicated in this curve.
6. Curves apply from -20°C to +50°C ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C.
7. This curve is for 50Hz or 60Hz applications.
8. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
9. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

PT20/25 - Long Delay Protection with I^4t Curves and Short Delay Protection with Flat Curves

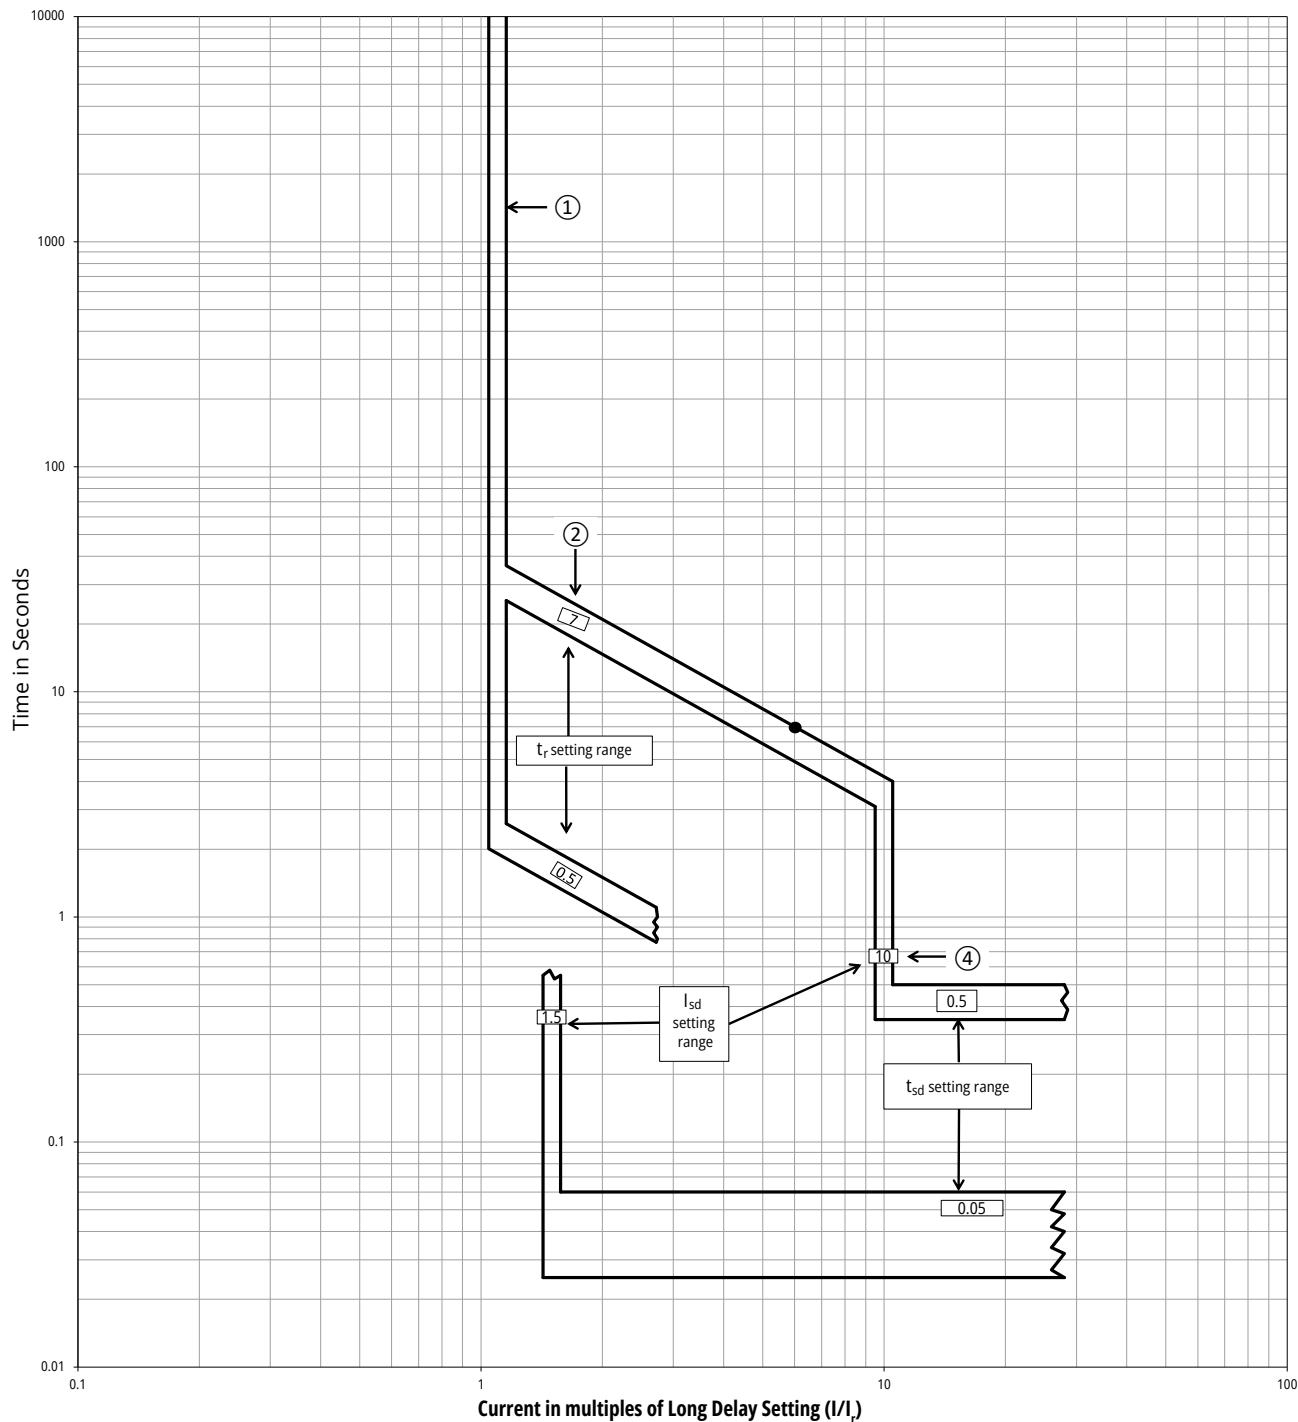

Notes:

1. Short delay pickup setting is 1.5x to 10x of I_r .
2. Long delay time setting is 0.5s to 24s, with +0/-30% accuracy.
3. If Thermal Memory is enabled for long delay, trip times may be shorter than indicated in this curve.
4. Curves apply from -20°C to +50°C ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C.
5. This curve is for 50Hz or 60Hz applications.
6. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
7. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

IZM6 Series Air Circuit Breakers

Tripping Characteristics

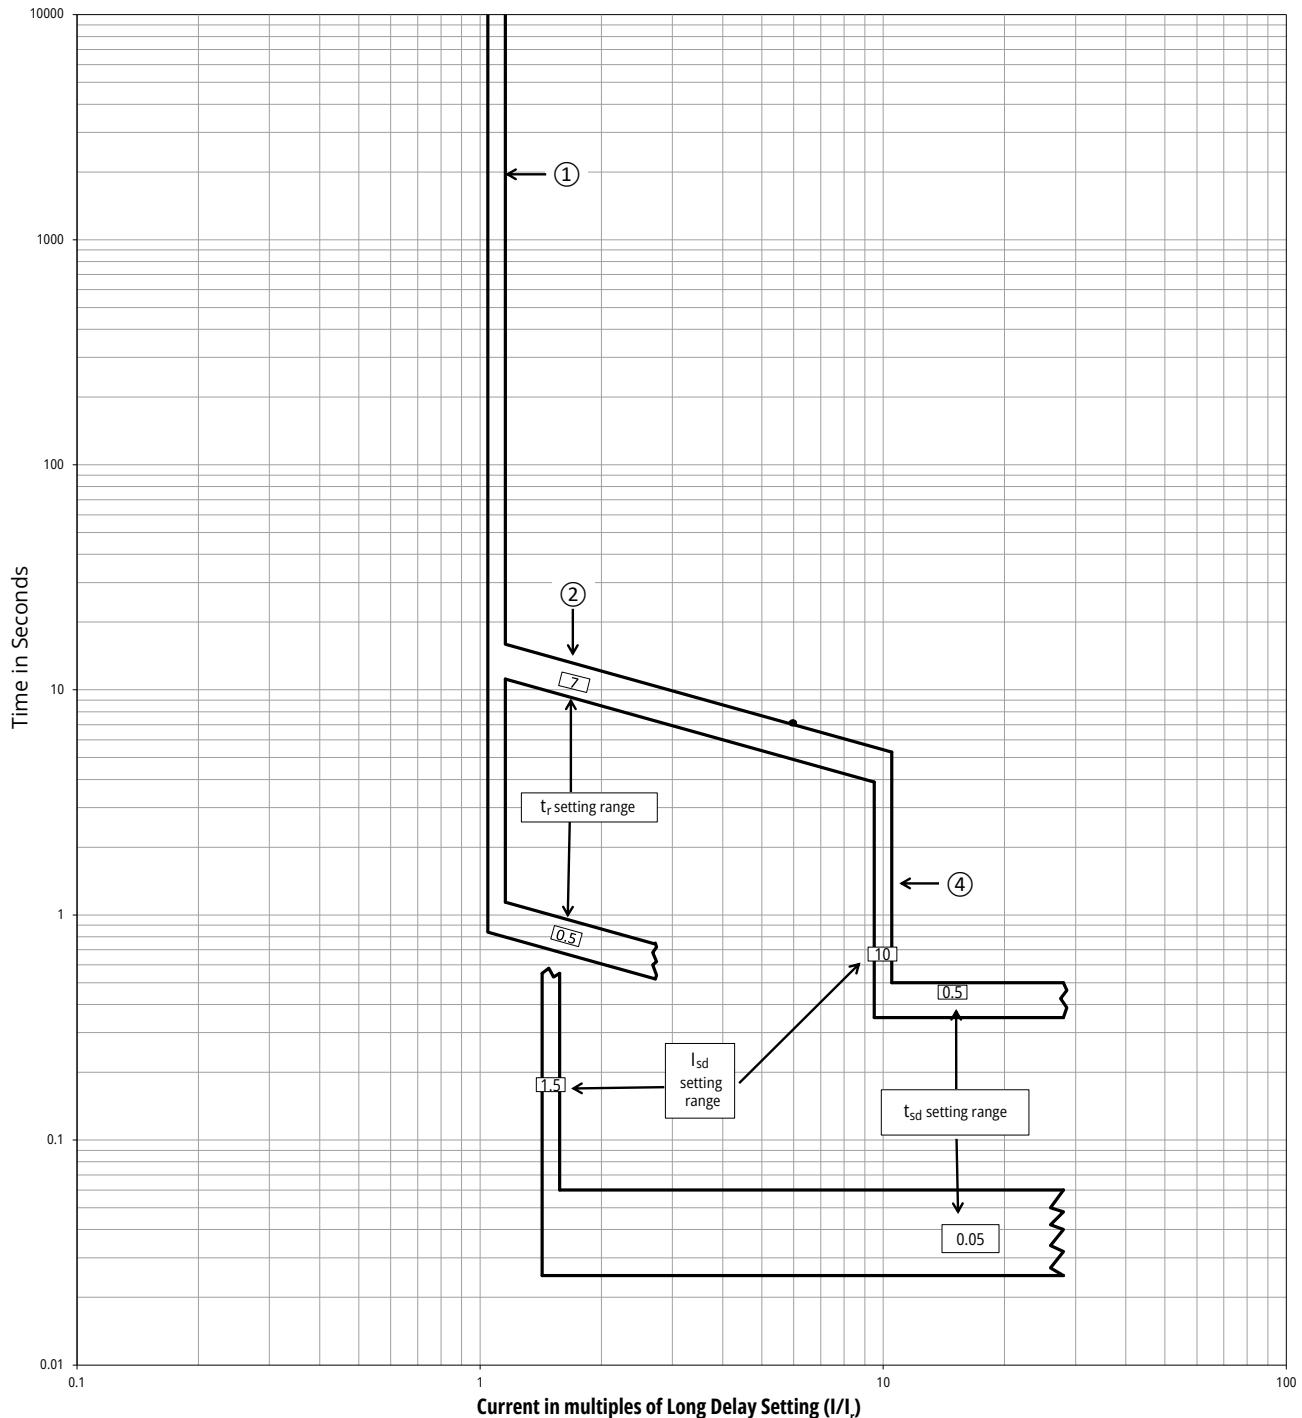

PT20/25 - Long Delay Protection with I^t Curves and Short Delay Protection with Flat Curves

Notes:

1. Short delay pickup setting is 1.5x to 10x of I_0 .
2. Long delay time setting is 0.5s to 24s, with +0/-30% accuracy.
3. If Thermal Memory is enabled for long delay, trip times may be shorter than indicated in this curve.
4. Curves apply from -20°C to +50°C ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C.
5. This curve is for 50hz or 60Hz applications.
6. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
7. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

PT25 - Long Delay Protection with $I^{0.5}t$ Curves and Short Delay Protection with Flat Curves

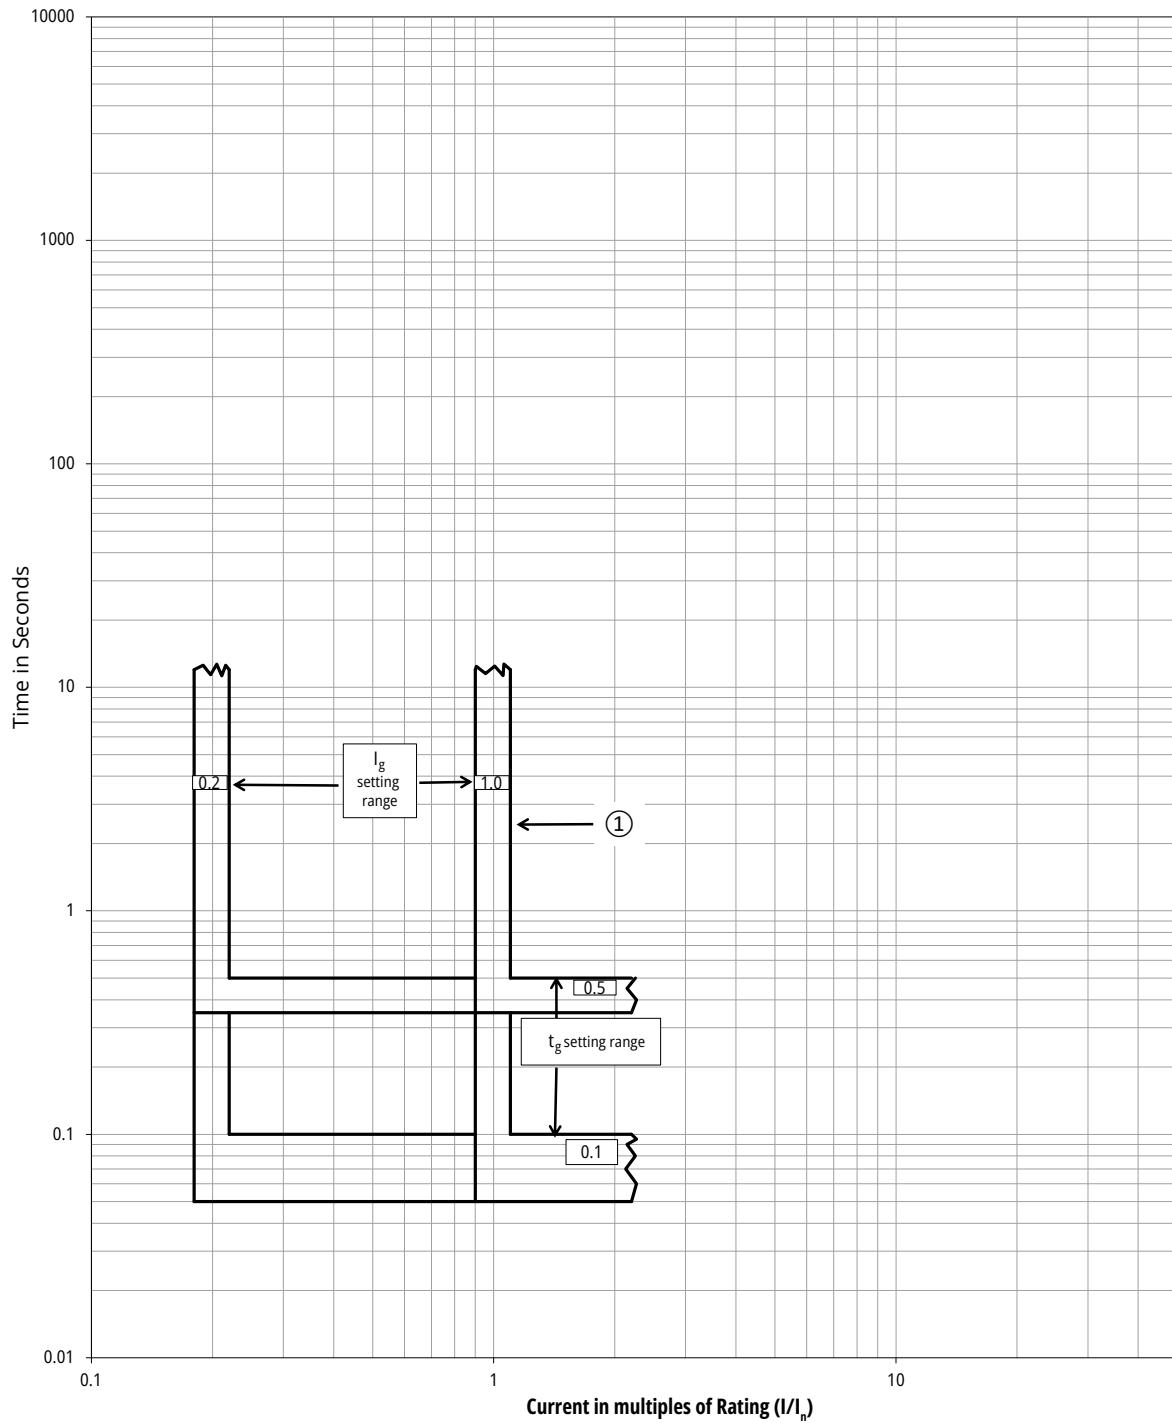

Notes:

1. Short delay pickup setting is 1.5x to 10x of I_r .
2. Long delay time setting is 0.5s to 24s, with +0/-30% accuracy.
3. If Thermal Memory is enabled for long delay, trip times may be shorter than indicated in this curve.
4. Curves apply from -20°C to +50°C ambient. Over-temperature tripping will be caused when the temperature exceeds 85°C.
5. This curve is for 50Hz or 60Hz applications.
6. These curves are comprehensive for series IZM61/65/67 circuit breakers, including all frame sizes, ratings and constructions.
7. The total clearance times shown include the response time for trip unit, the breaker opening time and the interruption of the current.

8. This protection is functional even when the Instantaneous is set to the OFF position.
9. The PT unit will light the Instantaneous LED for a High Instantaneous protection action.
10. The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific systems and settings.

IZM6 Series Air Circuit Breakers

Power Loss, Derating Factor and Copper Bar Specification

Power Loss (with Ambient Temperature at +40°C)

Power loss is the total power consumption measured when the frame rating current I_n passes through the circuit breaker.

Model	Power loss (W)	
	Fixed type	Withdrawable type
IZM61 1600A frame	123.5	331.5
IZM65 2500A frame	356.8	823.4
IZM67 4000A frame	486.7	856.8

Temperature Derating

When the working ambient temperature is higher than +40°C, the continuous current carrying capacity can be corrected with reference to the following table:

Model	Rated current (A)	+40°C	+45°C	+50°C	+55°C	+60°C	+65°C	+70°C
IZM61 1600A frame	400-1250	1	1	1	1	1	1	1
	1600	1	1	1	0.95	0.93	0.87	0.8
IZM65 2500A frame	400-2000	1	1	1	1	1	1	1
	2500	1	1	1	1	0.99	0.94	0.88
IZM67 4000A frame	2000-2500	1	1	1	1	1	1	1
	3200	1	1	1	0.95	0.92	0.89	0.85
	4000	1	0.95	0.92	0.89	0.85	0.82	0.8

When the circuit breaker is installed at higher altitudes than 2000m, its electrical performance can be corrected with reference to the following table:

Altitude (m)	2000	3000	4000	4500	5000
Power frequency voltage withstand (V)	5000	4500	3500	3000	2900
Operational voltage	440/690	440/690	440/690	440/690	440/690
Short-circuit breaking capacity correction factor	1	0.83	0.71	0.66	0.63
Operating current correction factor	IZM61 1600A frame	1	0.98	0.93	0.9
	IZM65 2500A frame	1	1	1	0.97
	IZM67 4000A frame	1	0.93	0.88	0.85

Notes: The operating current derating correction factor is only for the maximum current in the frame.

Recommended Copper Bar Specifications

Rated current (frame level) I_{nm} (A)	Rated current I_n (A)	Recommended Copper Bar Specifications		
		Number	Horizontal outgoing	Vertical outgoing
IZM61 1600A frame	200	2	/	50×5
	400	2	/	50×5
	630	2	/	50×6
	800	2	/	50×10
	1000	2	/	50×10
	1250	3	/	50×8
	1600	3	/	50×10
IZM65 2500A frame	400	2	/	80×5
	630	2	/	80×5
	800	2	/	80×5
	1000	2	/	80×5
	1250	3	/	80×5
	1600	2	/	80×10
	2000	3	/	80×10
IZM67 4000A frame	2500	4	/	80×10
	2000	3	2	100×5
	2500	2	2	100×10
	3200	3	3	100×10
	4000	5	4	100×10

The copper bar specifications used in the table are when the circuit breaker is at the ambient temperature up to 40 °C, installed in an open area, and in accordance with the conventional thermal conditions in GB14048.2.

IZM6 Series Air Circuit Breakers

Electrical Diagrams

Terminal Numbers are Described as Follows:

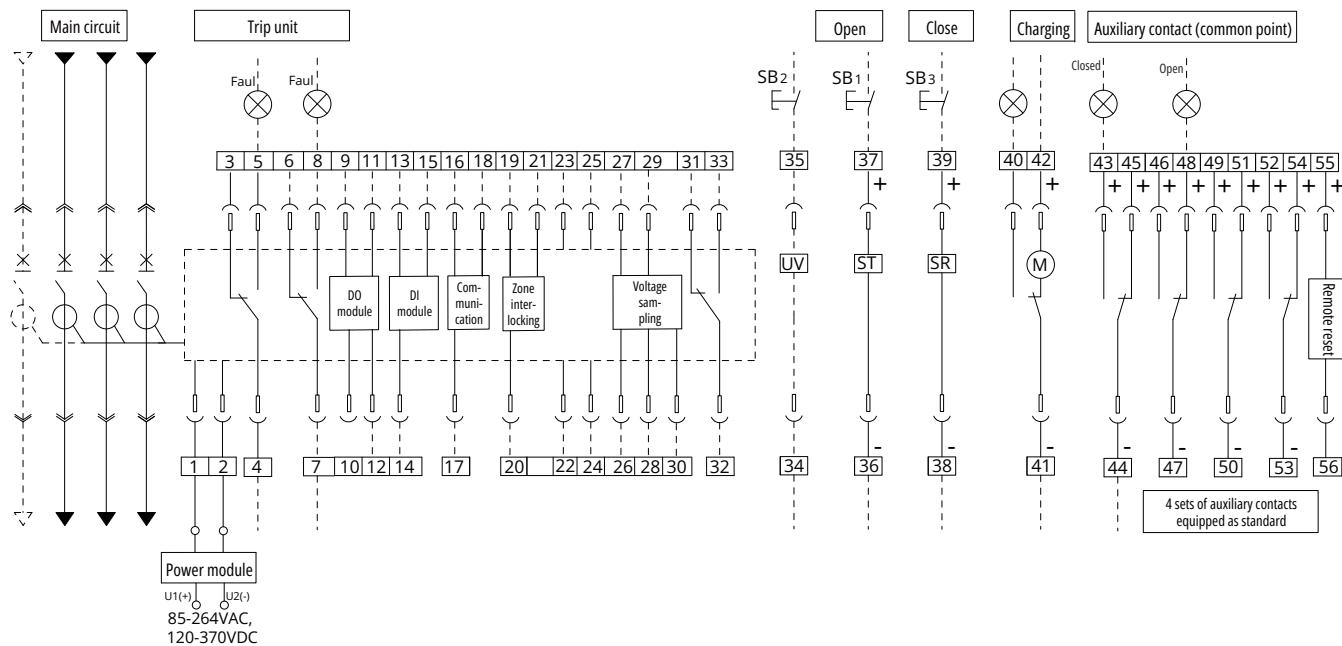

1# 2#	24VDC working power supply input
3# 4# 5#	Overcurrent trip switch (OTS) output
6# 7# 8#	Overcurrent trip switch 2 (OTS) output (added function)
9# 10# 11# 12#	Relay DO output (added function)
13# 14# 15#	Programmable DI input (added function)
16# 17# 18#	Communication wiring terminal (added function)
19# 20# 21#	Zone interlocking (added function)
22# 23#	External neutral transformer N1 N2 (added function)
24# 25#	Ground (added function)
26#	PE-phase wiring terminal
27#	Phase A wiring terminal ($\leq 690V$ line voltage) (added function)

28#	Phase B wiring terminal ($\leq 690V$ line voltage) (added function)
29#	Phase C wiring terminal ($\leq 690V$ line voltage) (added function)
30#	Phase N wiring terminal ($\leq 690V$ line voltage) (added function)
31# 32# 33#	LCS wiring terminal (added function)
34# 35#	Under voltage release wiring terminal (added function)
36# 37#	Shunt release wiring terminal
38# 39#	Closing release wiring terminal
40# 41# 42#	Motor operator wiring terminal
43#--54#	Auxiliary contact wiring terminal
55# 56#	Remote reset wiring terminal (added function)

Notes:

- 1) Position cell switch terminals do not pass through the secondary terminal
- 2) Buttons and indicator lights are provided by users themselves
- 3) The secondary wiring of the power module is shown in the diagram – the external power supply is input from U1 (+) and U2 (-), and the two output terminals of the power module are connected separately to corresponding secondary wiring terminals 1# (+) and 2# (-)
- 4) The circuit diagrams are the ones when the circuit breaker is in the open, released position.
- 5) This wiring diagram includes all the functions. Optional functions are available only after selected and equipped by users.

Minimum Clearances

Recommended Safety Clearances

The following information about safety distances is intended to provide a guideline for the installation of circuit-breakers in an enclosure.

	Enclosure clearance	To insulated surface	To grounded metal surface	With cell switch or locking facilities
		mm	mm	mm
Withdrawable	a	0	0	0
	b	25	25	25/75
Fixed	a	150	250	—
	b	30	70	—

Recommended Enclosure Clearance and Ventilation

The illustration shows a typical enclosure.

The table below lists the minimum distances between enclosures and ventilation openings. This information is intended as a guideline for constructing a suitable circuit-breaker enclosure.

About Eaton

Eaton is an intelligent power management company dedicated to protecting the environment and improving the quality of life for people everywhere. We make products for the data center, utility, industrial, commercial, machine building, residential, aerospace and mobility markets. We are guided by our commitment to do business right, to operate sustainably and to help our customers manage power — today and well into the future. By capitalizing on the global growth trends of electrification and digitalization, we're accelerating the planet's transition to renewable energy sources, helping to solve the world's most urgent power management challenges, and building a more sustainable society for people today and generations to come.

Eaton was founded in 1911 and has been listed on the New York Stock Exchange for more than a century. We reported revenues of \$23.2 billion in 2023 and serve customers in more than 160 countries. Eaton entered the Chinese market in 1993 and has grown significantly since then. In 2004, Eaton moved its Asia-Pacific headquarters from Hong Kong to Shanghai. Today, Eaton has nearly 8,000 employees and 19 manufacturing facilities in China.
